News

All that's new in the growing world of the Electron. **7**

Beginners

Part five of our gentle introduction to very basic Basic covers the INPUT command. **10**

Notebook

A simple graphics program explained. **12**

Setup

Choosing your text colours is made simple with this useful utility. **15**

Graphics

Mike MacManus delves deeper into Electron graphics and gets animated about it! **19**

Coder

A classic game from Roland Waddilove to test and trick your logical powers. **26**

Hardware Review

We look at the Signpoint Joypoint and give you a game to test it out. **28**

Program Probe

What little green aliens are made of - an in-depth analysis. **30**

Sounds Exciting

Enhance your library of sound effects with the latest collection of Electron noises. **32**

Cassettes Offer

Save yourself a lot of typing - we've got our programs taped to spare your fingers. **34**

Software Surgery

All you want to know about the latest in software from our frank reviewers. **35**

Smiler

A graphics program to make you grin. That's guaranteed. **38**

Casting Agency

More shapes from our readers to brighten up your programs. **40**

Money Maze

Avoid the ghosts and collect the coins in this all-action arcade classic. **43**

VAT

The simple way to please the taxman. **44**

Crystals

Beautiful graphics from a simple program. **45**

Special Offers

There's cassettes, back numbers and lots, lots more for the keen Electron user. **46**

Competition

Explain our funny program and win yourself a printer interface and user port from Broadway Electronics. **49**

Showtime

Come and meet us at the Electron and BBC Micro User Show. **50**

Maths Workout

Mike Bibby takes us into the world of hexadecimal numbers. **54**

Micro Messages

The pages you write yourself. A selection from our mailbag. **61**

NEW
ELECTRON INTERFACE UNIT

Expand your Electron.

Now you can use your Electron computer with any standard printer using MUSHROOM's new printer and user-port interface.

Bring your Electron up to the same standard as the BBC Model B computer printer and user-port into which you can plug robot arms, joy sticks or any BBC user-port module.

On the whole range of MUSHROOM modules and interfaces, the Electron edge connector is extended to give you unrestricted compatibility with any other Electron interface.

All MUSHROOM interfaces can be used separately or can be combined into the unique MUSHROOM ELECTRO-RAK which is conveniently connected to the Acorn Electron by a short cable.

This greatly enhances the performance of the Electron and turns the system into a computer comparable with many larger mini systems and as you grow your computer can grow with you!

Ask for details on:

- * SIDWAYS ROM CARD
- * A-D JOYSTICK INTERFACE
- * EPROM PROGRAMMER
- * MUSHROOM ELECTRO-RAK

- * FULLY CENTRONICS COMPATIBLE
- * FULL SOFTWARE PACKAGE (including screen-dump routine)
- * BBC COMPATIBLE 8-BIT USER PORT

Another Mushroom product from Broadway Electronics.

Electron Eddie-torial

IT happened again the other day. A father, in the office for another reason, came out with the fact that his son had "written a program".

The son, who was with him, blushed and tried to shut his dad up. Undeterred, the proud parent carried on describing his offspring's program.

It sounded interesting, so I asked them to send it in, which they duly did.

And it was smashing, a really nice piece of work. I enjoyed running it and also enjoyed figuring out how it was done.

I'm going to use it in the magazine and encourage him to send in any more he may have written.

Yet if his dad, no mean programmer himself, hadn't said anything, I

would never have seen it.

Instead of being shared with all the readers of *Electron User*, probably only a few of his friends would have seen it.

Art experts say that there are still lots of lost masterpieces gathering dust in attics and cellars, their owners having no idea of their worth.

I wonder how many cassette tapes are similarly gathering dust. The program, once lovingly slaved over, lies forgotten.

Why are programmers so modest? The hours they spend bent over the micro

typing away must be of value to them.

Why don't they share it with other micro users? If it was of some interest to you, it will probably interest others.

So if you've got a masterpiece or, at least, a program that you've thought was useful enough to spend your time writing, then let's have a look at it.

It could end up as a feature in *Electron User*. You'll be sharing the products of your creativity with many thousands of other Electron users.

And don't underestimate

yourself. Perfection isn't required, though it is welcome. If you don't believe me take a look at the programs of my own that I've published!

What is required is enthusiasm, energy, and a sense of humour.

People who talk to me about *Electron User* keep saying "your magazine". They've got it wrong.

It isn't my magazine, it's *YOUR* magazine - the magazine written for Electron users by Electron users.

But I can't use your work if it's hidden in the attic.

KAY-ESS

COMPUTER PRODUCTS

PROFESSIONAL PROGRAMS FOR THE MODEL B AND ELECTRON

NEW LOW SUMMER PRICES EACH TAPE ONLY £5.95

DESIGN (B)(E) NEW VERSION

If you enjoy the idea of creating your own user defined characters but are put off by the time consuming mathematics, then DESIGN is for you! DESIGN lets your imagination loose by letting you draw your characters in all 16 colours on an 8 x 8 grid leaving all the hard work to the machine. DESIGN's features include being able to recall multiple characters for re-editing and displaying. VDU 23 commands. All characters used in KAY-ESS programs are created using DESIGN.

SPACE TRAFFIC CONTROLLER - NEW (B)(E)

As a space traffic controller you have been stationed at the main robot cargo port of the planet Ori-7. It is your job to get the robot spacecrafts down in one piece. As your confidence increases you can increase the number of crafts allowed within your control area. Warning: not to be played after a hard or hectic day!

SPACE TANK (B)

After your SPACE TANK has landed on the planet Orion, a series of alien tanks, surface trippers, and spacecrafts will attack. How long can you hold out commander? This game makes use of the Beeb's fast scrolling ability. Can be used with either keyboard or joystick. Top ten table. Pause option.

HORSES (B)(E)

Come on now, don't be shy, choose one of the six horses and let's see what you can do. How many of the fences can you complete at the Orion arena, especially with the clock ticking away? New riders can try one of the more docile horses, while others may like to risk one of the more lively beasts! Can be used with either keyboard or joystick. Top ten table. Pause option.

STAR HAWKS (B)(E)

Can you stop the STAR HAWKS before they stop you? Show work means the generation of more laser firing mutant hawks. Based on the games of Galaxian and Gorf. Can be used with either keyboard or joystick. Top eight table. Pause option.

ELECTRON PROGRAM CAN BE USED WITH FIRST BYTE JOYSTICK INTERFACES

Watch out for special KAY-ESS double sided tapes at local dealers.

Dealer enquiries welcome.

KAY-ESS computer products previously traded under the name of ORION SOFTWARE

HANGMAN (B)(E)

Let words become full again with our three language (ENGLISH, FRENCH (FALIAN), version of the popular game of HANGMAN. There are 3 levels of play for each language. All words can be replaced or removed, and new ones can be added. HANGMAN comes with an instruction program giving full details for parents and teachers. Once running prying eyes cannot access the word lists!

EARLY YEARS (B)(E) For children between 3-6 years of age.

These two packages give an adult or older child a means to take a younger child through a series of simple game type tasks to enforce ideas. The emphasis is on learning through fun. Topics covered include subtraction, addition, recognition, colour, shapes, sizes, sound/notes, co-ordination, distances, estimates, directions.

EARLY YEARS 1

- A) MICKEY THE MONKEY and his apple tree make subtraction fun
- B) COLOUR BLOCKS bring sizes and colour into perspective
- C) MERRY MUSIC turns the keyboard into a musical keyboard
- D) FUNNY FACES presents a line up, which one is the suspect?
- E) FRED THE FROG needs co-ordinated help to get across the pond.

EARLY YEARS 2

- A) THE POND seems very active today
- B) SPEED is required to keep the cake on the conveyor belt
- C) DIRECTIONS seem to be needed by everyone in Orion village
- D) ORDER the blocks
- E) SID THE SPIDER needs some help to get out of the maze.

All prices are FULLY inclusive for UK orders. Please add £1 per tape for non-UK addresses.

Cheques/P.O.s should be made payable to KAY-ESS Computer Products.

ANSWER BACK SENIOR QUIZ GENERAL KNOWLEDGE

*THE ULTIMATE EDUCATIONAL QUIZ
FOR AGES 12 & OVER*
BBC (32K)-ELECTRON

The ANSWER BACK Quiz provides an incredible adventure in education by combining a compelling Space-Age game with an immense series of questions on General Knowledge. The thought-provoking and well-researched quizzes contain an enormous total of 750 questions with 3000 answer options covering the following subjects:

Astronomy Music Natural History Famous People Science Sport
 History Art and Architecture Know your Language Discoveries and
Inventions Legends and Mythology Geography Literature
 Films, TV and Theatre Pal Luck

The highly sophisticated control program rewards each correct answer with another turn in the colourful, animated game.

FEATURES INCLUDE

Multiple choice answers True or False? Find the missing letters
 "Pass" facility Immediate correction of errors Timer option
 Performance summary Re-run of questions passed or incorrectly
answered Full facilities for creating and saving an unlimited number of new
quizzes

INCREDIBLE ANIMATION BROUGHT TO YOUR BASIC PROGRAMS

SIMONSOFT SPRITES VERSION TWO

£12.95 for the Electron

A 14-FOLD INCREASE IN SPEED (Electron) of your own character designs makes this the FASTEST EVER screen movement seen in Basic programs on the Electron. Amazing animation effects are available at a command, yet no knowledge of machine code is required. This incredible extension to your machine's facilities is RAM based and your whole program can be SAVED/LOADED at the same time as the control coding and sprite images (your character designs). The designs and the control routine need take as little 8600 (1.5K) from the memory space of your machine!

LOOK AT THESE FEATURES:

1. **SPRITE GENERATOR PROGRAMS** to create your own sprite designs. All 16 colours may be used in each design, with characters as small as one pixel or as large as the 24 x 24 pixel SUPERSPRITE. As you design the sprites they are automatically stored in the machine code control routine so that you can delete the generator program before writing your own Basic.
2. **UPTO 48 SPRITES ON SCREEN** with 12 separate sprite designs, each with 3 independently controlled clones.
3. **INSTANT ANIMATION** with two images in each sprite design. These are switched automatically as the sprite crosses the screen, allowing effects such as hopping frogs, running men, etc.
4. **COLLISION DETECTOR** with a hit flag that is set to the number of any sprite overlapping with the sprite just moved. When the sprites move apart, there is no disruption of the sprite character designs.
5. **ENLARGEMENT FACILITY** of x2, x3, x4, x5 magnification of the normal sprite size! Let your invaders loom out of the screen in 3D effects — or use enlarged sprites throughout your program!
6. **FOUR PRESET FLIGHT PATHS** designed from the generator programs. Each path has 8 definable directions, with up to 255 steps allowed in each direction. Once sprites have been allocated to a path, they will move automatically as your program runs.
7. Both EOR and TRANSFER plotting of sprites to the screen are available.
8. A **SPRITE LIBRARY** of sprite designs ready for use in your programs with 'books' such as 'GHOSTS' and 'MEN'.
9. **SPRITE POSITION COORDINATE VARIABLES** which are reset automatically by the control coding. As you move your designs, the 'old' images left behind are deleted automatically as well.

This amazing package includes control routines containing different combinations of the above features — choose the routine best suited to the program you want to write. A comprehensive colour manual, an introduction program and two arcade style demonstration games are also included in the package. Compatibility with all other Electrons make our animation routines ideal for serious programmers — and we won't claim royalties on programs you market that use sprites!

SUPERFRUIT £5.95 for the ELECTRON

Simply the best. Full colour high resolution graphics. Spinning reels with 'bounce'. Incredible gamble effects: hold, 3 types of gamble, swap reels, two-way nudge, nudge gambles, coin pile that shrinks/grows, great sound effects. Separate instruction program. This implementation is in a class of its own.

"You would be fully justified in claiming that it is better than the real thing" — M. Field, Oxford.

PROGRAMMERS — WE PAY 30% ROYALTIES FOR
EXCELLENT PROGRAMS

electron user NEWS

Pirates to take pounding

THE END of software piracy may be in sight with the launch of a new system of program protection from A&F Software of Rochdale.

The techniques are based on a system developed by Jim Lamont, who recently had one of his program protection devices put on the secret list by the Ministry of Defence.

The aim is to make it virtually impossible for schoolchildren and computer clubs to make audio copies of software.

A&F, which markets the successful Cylon Attack for the Electron, is confident that the method will deter all but the most skillful from attempting to copy its cassette tapes.

Electron to speed up NHS communications

THE Electron has been chosen to help streamline a vital area in the work of the National Health Service.

It has been incorporated as the nerve centre of an electronic mail device to speed up medical lines of communication.

This is the first major commercial venture to feature the Electron.

Using conventional telephone lines it can automatically send and receive pages of vital data on patients when linked to others in a network.

It will eliminate potentially dangerous delays which are known

to exist within the NHS.

For messages despatched by even the internal mail services of some large hospitals can take up to four days.

"We identified a real need within the National Health Service to improve their communications", a British Telecom Merlin spokesman told *Electron User*.

"This need exists not only within hospitals but also between a hospital and medical people who work in the region it serves.

"Changes in medical procedures mean that patients today are being sent home much sooner after operations.

"So the back-up

medical workers must receive up-to-date information on patients' needs regarding medication and other necessary support by the time they get home.

"Here then is the answer".

All that is needed to bring the equipment immediately into service is to plug it into any available telephone jack point.

The reason for using the Electron?

"It's simply because it's the best on the market for what we wanted, in that it has a large expansion bus", said a BT spokesman.

A complete network is already destined for

the Hammersmith and Fulham district health authority. Installation is scheduled to start at its operational base, Charing Cross Hospital.

After this the network will be extended to take in doctors and key health workers throughout Hammersmith and Fulham.

"We conducted most of our research into the project in this area, so we are particularly pleased that they will be the first to take advantage of it", said the BT spokesman.

"Here we have something that could be vital to any large organisation in which a lot of people need to be able to contact one another. "As such the potential market is enormous".

Why add-ons were scarce

THE world shortage of silicon chips has been one of the principle reasons for the long delays in Electron peripherals reaching the market.

Chips that used to be delivered within a fortnight of being ordered now have a waiting time of six months or even a year.

Because of this, and the scarcity of components it has brought about, manufacturers of Electron add-ons are having difficulty in achieving

anything like full production.

"When we planned our interface six months ago all the chips we used were easily available", said one manufacturer.

"Now we have to wait three months for our next delivery of some vital components - and even that is just a promise, not a firm delivery date".

And it's not just delivery dates that have been affected. The shortage of silicon chips

has caused prices to rise dramatically.

"All our pricing has gone haywire", he said. "One of the chips we use cost less than 10p before Christmas. Now they cost over a £1 each, and that's if we're lucky enough to get them in the first place.

"The only comfort is that it's not just our peripheral that suffers. Everyone is in the same boat".

● Hardware galore - Page 8.

Acorn on TV

THE Electron is the star of a new television series aimed at teaching beginners how to program properly.

Produced by Yorkshire Television, "Me and My Micro" starts on June 10.

By the end of the series of five half-hour programmes viewers will know how to write amusing games in a structured manner.

HARDWARE GALORE!

THE waiting is over. Hardware add-ons for the Electron are a reality — and they're available now.

After months of promises, speculation and delay, the market is beginning to be flooded with all sorts of peripherals for the Electron.

And the manufacturers promise that there's a lot more where they came from.

The first add-ons that became available to the public after the drought were the joystick interfaces from Signpoint and First Byte.

These are pieces of hardware which fit onto the expansion bus at the rear of the micro. They allow joysticks to be used to control games in place of the keyboard.

Both are supplied with software to enable the interfaces to be used with commercial games.

Printer interfaces formed the second wave of add-ons to hit the market.

Again Signpoint was the first to offer its Printport printer interface to the general public.

Attaching to the Electron's expansion bus, it

Wait for Electron add-ons is over

enables it to use any Centronics standard printer such as the popular Epson and Seikosha models.

Another Centronics printer interface for the Electron has been produced by Broadway Electronics of Bedford.

This comes with drive software and a screen dump routine.

It also contains an 8 bit user port, allowing the Electron some of the interfacing possibilities of the BBC Micro, and has a rear expansion bus.

Sir Computers of Cardiff has also produced a Centronics printer interface. This one is supplied with an analogue-to-digital converter, allowing the use of joysticks.

This ADC, and the fact that the Sir interface has a built in edge connector, provides for

further expansion of the Electron.

Not to be left out, Silicon Substrate has brought out its Electron "PR-Interface".

Self-contained, it does not require cassette based software to be loaded each time the printer is to be used.

The interface is being marketed by Micro-Aid of Cornwall. They are offering the interface, plus the new Seikosha GP-50A five inch dot matrix printer and the necessary leads, as one package.

It's not just joystick and printer interfaces that have appeared.

From Northern Computers of Frodsham comes an external ROM box for the Electron.

Made of steel and with a clear Perspex top, it allows up to eight ROM chips to be used with the Electron.

Sir Computers has also produced a ROM board which allows up to 12 ROM-based software chips to be used.

As is becoming standard with Sir products, there is scope for expansion via a rear edge-connector.

Broadway Electronics is also planning a sideways ROM board which is seen as part of whole expansion system for the Electron.

The firm intends that future add-ons will all fit on a "motherboard". This unit will plug into the back of the Electron and allow more than one add-on to be installed at one time.

Yes, things have quickly changed from a situation where Electron users were hard pressed to find an add-on for their micro. Now the difficulty is which one to choose.

Broadway printer interface and user port

First Byte joystick interface

Signpoint Printport

Signpoint Joypoint

Discs on the way, too

IT will not be long before disc interfaces for the Electron are a reality.

At least two firms are putting finishing touches to their systems and hope to have them on the market by late summer.

Pace of Bradford has developed a disc interface for the Electron using the Amcom Disc Filing System.

It is capable of working with either 5¼ or 3 inch drives.

It has its own power supply – with an output for other devices – and an edge connector bus.

A prototype version was on show at the spring Electron User Show.

This created a huge amount of interest, and encouraged Pace to go into full production.

However, there is already a rival on the scene.

Broadway Electronics of Bedford is developing a disc interface for the Electron as part of its range of add-ons.

This will be in the form of a card that fits into the Broadway motherboard expansion system.

With the advent of these disc interfaces, the Electron becomes a sophisticated machine, outclassing any of its competitors.

IT is possible that soon Electron owners could be spending more time reading about their Electrons than actually using them.

At least it seems that way from the number of books about the micro that have appeared on the market.

From Granada comes "Practical Programs for the Electron" by Owen and Audrey Bishop.

Already known for their "Take off with the Electron", the Bishops use the same simple but thorough approach in their latest book.

Read all about it..

It gives 14 well-explained programs for the Electron, each one intended to be useful rather than just amusing.

Also from Granada comes "Advanced Electron Machine Code Techniques" by A.P. and D.J. Stephenson.

Starting where Ian Sinclair's "Electron

Machine Code for Beginners" finishes, the book examines the 6502 instruction set in detail.

It also covers the use of the Electron's assembler, giving fast machine code programs for filing and indexing and shows how flickerless animation effects can be achieved.

Another follow-up book comes from Addison-Wesley in the shape of "Advanced Programming Techniques for the Electron" by Jim McGregor and Alan Watt.

This takes the structured programming techniques used in their earlier volume – "The Electron Book: Basic, Sound and Graphics" – and expands on them.

Among the subjects explored are arcade games, databases, text programming and board games.

Chance for authors

A GLASGOW firm, Screenplay, has hit on a novel way of both promoting its own software and encouraging people to write new programs for them.

Inside every copy of Animator, Screenplay's sprite generator for the Electron, is a competition entry form.

Entrants are asked to write an original program in either Basic or

machine code using the sprites from the Animator.

As well as publishing it and giving the author royalty payments, a prize of £200 is offered for the winning program.

Even the authors of programs that don't win stand a chance of seeing their software published – and receiving payment for it.

Pad takes the toil out of plotting

HELP is at hand for frustrated contributors to Casting Agency in the form of the new Pixel-Pad from Computer Agencies.

Each pad consists of 50 sheets of A3 graph paper showing every PRINT and PLOT location for the Electron's graphics screen. They are used to plan a screen

display layout.

Along the side of each sheet are twelve 8 x 8 grids, ideal for creating user-defined characters.

On the inside of the pad's cover is a brief but thorough summary of the more useful graphics commands.

Bumper packs are available for schools.

Micro Press have published a book of 18 listings, "Quality Programs for the Electron".

Covering games, graphics displays and utilities, each fully structured program has a detailed description.

The aim of the book is to teach good programming techniques as well as to entertain.

Finally from Prentice Hall International comes "100 Programs for the Electron" by John Gordon.

The 100 listings cover a wide range, from games to data handling, from scientific and graphics routines to business programs.

A cassette containing all the programs is also available.

GOOD news for Electron users whose table tops are getting cluttered. Silent Computers of London has produced a console specially for this micro.

Not only will it house the Electron itself and support a monitor and cassette recorder, but it also allows for expansion interfaces to connect to the rear of the machine.

Designed with the approach of disc interfaces in mind, there is even room for two half height disc drives.

Part five of PETE BIBBY'S introduction to programming

LAST month I left you with a program to run and puzzle over. Did you guess that the answer would be 5? It's reprinted here as this month's Program I:

```
10 REM PROGRAM I
15 REM LAST MONTH'S VII
20 total=1
30 total=total+1
40 total=total+total
50 total=total+1
60 PRINT total
```

What happened was that line 20 set aside a piece of memory and labelled it *total*. It stored 1 in *total* and then the program went on to line 30.

Here the program told the Electron to take whatever value it had in *total* and add 1 to it.

Since the value already in that part of memory was 1, the sum is 2. (Do it on your fingers.)

It was then to put that value into the part of memory labelled *total*, overwriting whatever had been in there.

Now the memory labelled *total* has 2 in it.

Bearing this in mind, it should be easy to see why line 40 ends up putting 4 in *total*.

In plain English, the line would read: "Put into the memory labelled *total* the

result of adding whatever is in *total* at the moment to whatever is in *total* at the moment".

Since this is 2, the result is that 4 is put into that part of memory.

Finally line 50 takes the value now held in *total* (which is 4), adds 1 to it and puts the result, 5, into *total* (or, more properly, into the memory space labelled *total*).

Line 60 just prints out the value it finds in *total*.

You'll notice that the value of *total* has varied.

At first it was 1, then it was 2, next it was 4 and finally it was 5.

You can see why it is called a variable, can't you?

All *total* represents is a value stored in the part of memory which has that label.

The value that is placed in that memory space isn't fixed. It can change during a program, just as the value in *total* did in Program I.

We use these variables all the time ourselves.

We know that when we go shopping we have to pay a bill at the cashpoint. As we go round buying things we keep a variable in our head, probably something like *total cost*.

Every time we put something into our trolley we add its price to *total cost* to keep track

of how much we're going to spend.

You can see that the value of *total cost* will vary with each item we buy.

We do a calculation in our heads something like: "The new *total cost* will be the old *total cost* plus the *price* of this item".

As you can see, it's not that different from a line like:

```
total=total+1
```

The point to grasp is that variables can vary in value as you do different things to them.

They can be used until we want a final value to be returned from them, usually by a PRINT command:

```
10 REM PROGRAM II
20 gas=100
30 electricity=200
40 bill=gas+electricity
50 PRINT "The bill is ";
bill
```

Now let's look at Program II. Run it and you'll see that it adds together the gas bill and the electricity bill to produce a total bill held in the variable *bill*. This is then PRINTed out.

We could use this same program to calculate the total bill for other values of *gas* and *electricity*.

The only problem is that we have to type out lines 20 and 30 with the new values. If we're calculating a lot of different bills this means a lot of typing.

Wouldn't it be nice if we could arrange it so that we could enter the values of *gas* and *electricity* while the program is running? Then we wouldn't have all that typing to do.

We'd just run exactly the same program over and over, putting in the new values for the variables as required.

The program would remain exactly the same. Only the variables would vary.

Program III shows how this is done, using a new Basic command INPUT.

This allows a program to be written using variables which

aren't given their actual values until it is run:

```
10 REM PROGRAM III
20 INPUT gas
30 INPUT electricity
40 bill=gas+electricity
50 PRINT "The bill is ";
bill
```

Try out the program and you'll see what I mean.

Type in RUN, press Return and all you get for your time and trouble is a question mark!

Don't worry, things haven't gone wrong (or, at least, I hope not).

What's happened is that the Electron has got to line 20, found the INPUT command and is now waiting for you to type in a number at the keyboard and press the inevitable Return.

It puts up the question mark to tell you that it's waiting.

When you get around to typing it in, it gives the variable *gas* that value.

The program then goes on to line 30, and finds another INPUT command.

It then throws up another question mark and waits for a value to be given to the variable name following the INPUT command.

So type in the value you want for *electricity*. Now that the INPUT has been satisfied, the program continues, giving us the total bill.

Easy, isn't it?

The good thing about the INPUT command is that we can now run exactly the same program and give it different variable values when it asks us for them. Try it and see.

INPUT holds up the program until you supply the required value and the Electron gives this value to the variable name following the INPUT.

The trouble is that you can forget which question mark is for which variable.

In our present case it wouldn't matter too much if we did get them mixed up. They would still add up to the same thing in the end.

However we'll soon be

Commands learnt so far:

```
CLS
NEW
PRINT
LIST
RUN
REM
LET
NAME$ = "LABEL"
INPUT ✓
```

Discover the value of variables

writing much more complex programs and won't want to be faced with a plethora of questionable question marks.

Program IV shows how to get round this:

```
10 REM PROGRAM IV
15 PRINT "Enter gas bill"
20 INPUT gas
25 PRINT "Enter electricity
bill"
30 INPUT electricity
40 bill=gas+electricity
50 PRINT "The bill is ";
bill
```

What we've done is to use the PRINT command to "label" each question mark. Now if we enter the electricity bill when it should have been the gas bill, it's our own stupid fault.

Having shown you how to use PRINT to tell us what the INPUT is asking for, I'll now inform you that you don't have to bother with it at all!

Instead of using the PRINT commands you can slip your message between the INPUT and the variable name. It will be shown on the screen just as if we'd used a PRINT statement.

This can save a lot of typing. Program V shows how it's done:

```
10 REM PROGRAM V
20 INPUT "Enter gas bill"
gas
30 INPUT "Enter electricity
bill" electricity
40 bill=gas+electricity
50 PRINT "The bill is ";
bill
```

Exciting stuff isn't it? I know that this example is fairly trivial. But now that you

can use the same program over and over again, with different values for the variables, you are really tapping the power of your Electron.

You may have noticed that in the last program no question marks appeared.

If you do want the question marks, just put in a comma between the message and the variable name.

Program VI shows this in action:

```
10 REM PROGRAM VI
20 INPUT "What's your
name", name$
30 INPUT "How old are you",
age
40 PRINT "Hello ";age;"
year old ";name$
```

Notice that in this program I've used INPUT to allow a string to be entered into the program. It's the one with the dollar sign on the end.

Program VI is fairly silly. But notice that the same program can be run by different people and they'll get different results.

A four line program is all things to all men, courtesy of two INPUT statements!

Remember how we saved a couple of lines by putting our messages into the INPUT command?

Well in Program VII we use one INPUT statement to request values for two variables:

```
10 REM PROGRAM VII
20 INPUT "Name,age",name$,
age
30 PRINT name$,age
```

All that's happened is that we've put the two variable names after the INPUT statement and message. To do this

you just separate them by commas.

When it gets to this line the Electron will show the message as usual, putting up a question mark to tell you it's waiting for something to be input from the keyboard.

When a number or string is given to the first variable name the Electron moves on to the next variable (after the comma) and throws up a question mark until you've dealt with that.

You can have more than two variables after an INPUT statement, always provided that you separate them by commas.

The trouble is that it can get a bit complicated unless you put in more messages.

Then the lines start getting long and you've defeated your purpose.

And that's it for this month. We've looked at how variables

can be used to stand for numbers that vary and we've seen how INPUT can be used.

Try writing your own programs using INPUT, maybe converting pounds to pence or hours to minutes.

INPUT is a very powerful command. When combined with other Basic commands that we will be covering next time, it really unleashes the power of your Electron.

I'll leave you with program VIII. Can you figure out what's happening?

```
10 REM PROGRAM VIII
20 total=0
30 FOR loop=1 TO 10
40 INPUT "Enter number",
number
50 total=total+number
60 NEXT loop
70 PRINT "The total is ";
total
```

Notebook Part 5

THE program featured in this month's Notebook comes from A.FARMER of Warrington, Cheshire.

It's a simple listing that uses the Electron's graphics commands to draw 100 randomly coloured lines on the screen, over and over again.

```

10 REM A. FARMER
20 REM RANDOM COLOURED
   LINES
30 REPEAT
40 MODE 2
50 VDU 23,1,0,0:0
60 count=0
70 MOVE 0,0
80 REPEAT
90 count=count+1
100 X=RND(1279)
110 Y=RND(1023)
120 GCOL 0,RND(7)
130 DRAW X,Y
140 UNTIL count>100
150 UNTIL FALSE
    
```

REM statements

Repeat
...until loop

Random
co-ordinates

Repeat...
until loop

Lines to make lines

Line No:	Description
10-20	REM statements which are ignored by the micro.
30-150	Form the first REPEAT . . . UNTIL loop which runs the main body of the program over and over again.
40	Puts the Electron into Mode 2, the graphics mode which allows 16 colours.
50	The VDU command switches off the flashing cursor.
60	Sets up a flag variable and gives it the value zero.
70	Moves the graphics cursor to the bottom left of the screen.
80-140	These lines form a REPEAT . . . UNTIL loop inside the first loop. The lines enclosed between them are repeated until the condition is fulfilled.
90	One is added to the value of the flag variable each time round the loop.
100-110	Random values are assigned to the graphics coordinates.
120	One of seven random colours is picked.
130	A coloured line is drawn from the end of the previous line to the point chosen by lines 100 and 110.
140	If the flag variable is not greater than 100 (that is less than 100 lines have been drawn) the program goes back to the REPEAT of line 80.

Trevor Roberts

Here's something **SPECIAL** from

electron
user

We've commissioned four rip-roaring games for the Electron and BBC Micro

Three of this high-powered collection are top-rate machine-code versions of arcade classics and the fourth is a thrilling real-time adventure game. There's hours of enjoyment and something to suit everyone in this unique value for money collection

SNAPMAN – Guide your man through the maze as he munches energy pellets and avoids hostile aliens

ALIEN INTRUDERS – With only your laser for protection you must destroy the waves of aliens who threaten to engulf you

PANZER ATTACK – You are a tank commander engaged in vicious combat against encircling enemy forces

MAYDAY – A futuristic adventure! As captain of an interstellar cruiser you must guide the sole survivor of a stricken space freighter through the wreckage of his craft. If you fail to recover those vital medical supplies a whole planet is doomed!

Please send _____ copy/copies of
Classic Arcade Games.
I enclose a cheque/PO No. _____
for £ _____
made payable to: Database Publications Ltd.

- Electron tape £5.95
 BBC Micro tape £5.95
 BBC Micro disc £7.95
(Please tick)

OPTIMA SOFTWARE

The games that set the standard

SEA WOLF

So far all has gone well. You have successfully guided your submarine safely through enemy controlled waters and you are beginning to relax.

Suddenly alarm bells scream in your ears – you are under attack!

Desperately you scan the radar screen. Should you try to get him within range of your torpedoes, or attempt evasive tactics? Can you lead your crew to safety?

BED BUGS

The pests are after your feet and you'll have to move fast to stop them. Swot them with a jam sandwich or crunch them with your false teeth.

If you're desperate you can always phone for help. But whatever you do, do it quickly. You need cunning tactics and nimble fingers!

Bed Bugs guarantees hours of hilarity for the whole family.

OMEGA PROBE

Far out in the uncharted reaches of the universe lie the Omega zones from which no man has ever returned.

To explore this hazardous region the Earth's scientists have created the Omega Probe – the ultimate spacecraft.

As pilot of the probe, you face the unknown hazards of the Omega zones. Your mission: to survive.

This fast and furious machine code game with its tremendous graphics and many unique features takes arcade games to new heights of programming excellence.

Get these great games from your Acorn dealer or send off the coupon below to:

Optima Software Ltd, 36 St. Petersgate, Stockport SK1 1HL.

SETUP is a utility program designed to help the Electron user choose the background and foreground colours to be used in any mode.

At the start of the program, you are asked to enter which mode you want to use.

This can be any of the seven available and is the mode that will be used throughout SETUP.

The background colour will change first, cycling through the Electron's 16 colours.

After each colour change it will pause for a second. When the colour you want is on the screen, just press Return and the cycle will stop, leaving the background in that colour.

You then go through the same procedure with the foreground (text) colour. Again, press Return when you are satisfied with the colour.

Now the Electron displays the VDU statements which will produce that combination of background and foreground colours.

These can then be used in your own programs, making the text more colourful.

The variable *mode*, input in line 100, picks the mode that the Electron will work in.

Lines 160 to 200 form a FOR . . . NEXT loop which cycles through the background colours.

Similarly, lines 230 to 270

```

SCREEN SETUP UTILITY                               IN MODE:1
SELECT BACK COLOUR THEN PRESS <RETURN>
SELECT FRONT COLOUR THEN PRESS <RETURN>
BACKGROUND:
VDU 19,128,0,0,0,0
FOREGROUND:
VDU 19,135,7,0,0,0
  
```

```

SCREEN SETUP UTILITY                               IN MODE:5
SELECT BACK COLOUR THEN PRESS <RETURN>
SELECT FRONT COLOUR THEN PRESS <RETURN>
  
```

cause the Electron to work through the foreground colours.

The wait between each colour is determined by the INKEY of line 170. This delay can be made shorter or longer simply by changing the value in the brackets.

Lines 180 and 250 use INKEY again, this time to test if the Return key has been pressed.

If this is the case, the Electron is sent to the next section of the program.

COLOUR IT QUICKLY!

Reader ANDREW OLDHAM has sent in this extremely useful program to help set up your screen colours

```

10 REM SCREEN SET-UP PROGRAM
20 REM A.OLDHAM
30 REM (C) ELECTRON USER
40 REM *****
50 MODE 6
60 ON ERROR GOTO 330
70 PRINT "SCREEN SETUP UTILITY FOR THE *ELECTRON*"
90 PRINT STRING$(39,"-")
90 PRINT TAB(0,10);"WHICH MODE DO YOU WANT TO USE ";
100 INPUT mode
110 IF mode<0 OR mode>6 THEN GOTO 90
120 MODE mode
130 CLS
140 PRINT "SCREEN SETUP UTILITY"SPC(7);"IN MODE:";mode
150 PRINT "SELECT BACK COLOUR THEN PRESS <RETURN>"

National Micro

BARGAIN OF THE MONTH

DRAUGHTS (Acomsoft)

Special price valid to May 31, 1984. £7.99

How to get a generous discount on all your purchases!

WHAT YOU DO

Either purchase three items of software for the price of two (lowest priced item free) or make purchases to the value of £100 or more.

WHAT YOU SAVE

- All subsequent purchases totalling over £25 are eligible for discount* of:
 - 10% on software
 - 5% on hardware
 when you quote your membership number.
- If you buy at least one item of software every month you get 10% discount on all such purchases. Ask for a registration card to take advantage of this scheme.
- The opportunity to enter the members' competitions run throughout the year. Just ask for competition entry form when you send in your order.

Ask for an application form at any of our outlets or write for a form to:

**National Micro Centres
Computer Club,
36-38 St Petersgate,
Stockport SK1 1LH.**

* Discount only applies to our normal prices and not to any special offer prices which may be in force for the time being.

Our top best-sellers

Birds of Prey (Romik)

A fast moving invaders type game where the aliens in space take the form of birds. Good value for money. £6.99

Twin Kingdom Valley (Bug-Byte)

Not only a good adventure but all 175 locations are drawn in full-screen hi-res graphics. A sophisticated adventure game. £9.50

Chuckie Egg (A & F)

Just when you thought it was safe to go back on the farm this game makes you think again. The idea is to collect eggs before storks devour corn or you. A progressive game requiring extremely high skill levels. The nightmare has begun! £7.90

Killer Gorilla (Micropower)

Fast becoming a cult game. Dodge tumbling barrels and blazing fireballs as you battle to rescue the damsel in distress. Gripping multi-level action. £7.95

Cylon Attack (A & F)

"Outstanding ... quite simply excellent ... the graphics leave most other games standing". - Micro User. £7.90

Now YOU can go for gold ...with the

Fancy pitting yourself against the world's best at this summer's Olympics?

You can do so without going anywhere near Los Angeles – with the most challenging package of programs of 1984.

MICRO OLYMPICS is more than a game. It's a brilliantly written collection of ELEVEN track and field events.

And because we know we're going to sell many thousands of them we've brought the price right down – to just £5.95.

Ever imagined yourself as another Seb Coe? Then try to run against the world record holder at 1500 metres. And if that distance is too much for you then there's always the 100, 200, 400 and 800 metres to have a go at.

Not much good at running? Don't worry, MICRO OLYMPICS has many more challenges for you. Why not try your skill at the high jump or the long jump?

And if you can't beat the computer at running or jumping then you can always throw things around in frustration! The trouble is that it's just as hard to be a champion at the discus, the hammer or the javelin.

And the pole vault takes the event to new heights!

Yes, it's fast, furious fun, pitting yourself against the world's best times and distances on your micro.

You may not be another Steve Ovett or Alan Wells, but with practice you COULD become the Micro Olympics Champion!

*This is a special joint offer from
The Micro User and Electron User*

**Play Micro Olympics
– and let your fingers
do the running!**

Liven up your screen with VDU19

WE have already covered the use of the VDU19 command to change the text colours available to us in any mode. Now we'll be looking at some of the ways these VDU19s can be used to liven up the screen.

This will give us a lot of practice using them. Hopefully, by the time the article is finished, a mention of VDU19 will hold no fears.

Anyway, let's get straight on to the first program:

```
10 REM PROGRAM I
20 MODE 5
30 VDU 23,1,0;0;0;0;
40 PRINT TAB(2,5)*THIS IS
  A MESSAGE*
50 REPEAT
60 palette=RND(7)
70 VDU 19,3,palette,0,0
  ,0
80 FOR delay=1 TO 1000
  :NEXT
90 UNTIL FALSE
```

I'll admit that this isn't the world's most exciting bit of Basic, and the results won't amaze and astound your friends.

It does, however, contain some important points. Let's have a good look at it.

Lines 10 to 30 just tell you what the program is called, put the Electron into Mode 5 and switch off the flashing cursor.

Line 40 prints the message in the inverted commas onto the screen, three spaces in from the left and six lines down from the top.

If the positioning seems odd, remember the first space and line are both numbered 0.

Lines 50 to 90 produce an endless REPEAT... UNTIL

loop which does all the colour changing.

Line 60 just gives the variable *Spalette* a random value.

This variable is then used in line 70's VDU19 command to reassign the colour that will appear wherever we've previously written in colour code 3.

Everything displayed under that colour code number will turn to the new colour defined by *Spalette*. Line 80 just delays things for a while so we can see what's happening.

The Electron then carries on around the loop, each time giving a random value to *Spalette*.

The colour codes (logical colour numbers) and palette colours (actual colour numbers) are shown in the familiar-looking Figure 1.

So by putting a VDU19 command into a loop we can get a flashing message on the screen.

And before you say that we can have flashing colours anyway, remember that these are limited to only a few combinations such as blue and yellow.

You can get any combination of the Electron's colours by using VDU19 in a loop. I leave that for you to try.

Program II is a variant of the last program.

Here two messages are printed on the screen. The first is printed by line 40 and is in the default colour code, code 3.

In Mode 5 this appears as white (until we do something about it with a cunning VDU 19).

Line 50 selects the text colour as colour code 2, which is defaulted to yellow. The program then runs into the endless REPEAT... UNTIL

```
10 REM PROGRAM II
20 MODE 5
30 VDU 23,1,0;0;0;0;
40 PRINT TAB(2,5)*THIS IS
  A MESSAGE*
50 COLOUR 2
60 PRINT TAB(2,15)*AND THIS
  IS ALSO*
70 REPEAT
80 palette=RND(7)
90 VDU 19,3,palette,0,0
  ,0
100 FOR delay=1 TO 1000
  :NEXT
110 UNTIL FALSE
```

MODES 0, 3, 4, 6

Logical number	Fore-ground	Back-ground	Colour (on entering mode)
0	128		Black
1	129		White

MODES 1, 5

Logical number	Fore-ground	Back-ground	Colour (on entering mode)
0	128		Black
1	129		Red
2	130		Yellow
3	131		White

MODE 2 (and actual colours)

Logical number	Fore-ground	Back-ground	Colour (on entering mode)
0	128		Black
1	129		Red
2	130		Green
3	131		Yellow
4	132		Blue
5	133		Magenta
6	134		Cyan
7	135		White
8	136		Flashing black/white
9	137		Flashing red/cyan
10	138		Flashing green/magenta
11	139		Flashing yellow/blue
12	140		Flashing blue/yellow
13	141		Flashing magenta/green
14	142		Flashing cyan/red
15	143		Flashing white/black

The logical colour numbers on entering mode 2 are also the actual colour numbers.

Figure 1

Graphics

From Page 19

loop formed by lines 70 and 110.

This does the same as the previous program's loop, randomly changing the palette colour assigned to colour code 3 each time round.

The result is that the first part of the message is changing colour all the time. The second part of the message, which has been written in colour code 2, stays unchanged.

This can be quite useful when you're creating eye-catching displays, such as sets of games instructions.

Program III takes the techniques of the previous two programs to produce a three line display. Each of these lines is a different colour and the colours change in sequence.

It's simple and can be quite effective. The only hard bit is figuring out the maths which decides which palette number is to be assigned to which colour code.

```

10 REM PROGRAM III
20 MODE 5
30 VDU 23,1,0;0;0;0;
40 PRINT TAB(2,5)"THIS IS
  A "
50 COLOUR 2
60 PRINT TAB(2,15)"ROLLING
  COLOUR"
70 COLOUR 1
80 PRINT TAB(2,25) "DISPLAY"
90 REPEAT
100 FOR X=6 TO 4 STEP -1
110 VDU 19,3,X MOD 3+1,0,0,0
120 VDU 19,2,(X-1)MOD 3+1,0,0,0
130 VDU 19,1,(X-2)MOD 3+1,0,0,0
140 FOR DELAY=1 TO 1000
  : NEXT DELAY
150 NEXT X
160 UNTIL FALSE
  
```

Lines 10 to 80 should be fairly familiar by now. Lines 90

and 160 form the familiar endless REPEAT... UNTIL loop.

What's different is that we now have three VDU19s instead of one and there's a FOR... NEXT loop in there as well.

Don't worry too much if you can't understand what's happening in the loops. All you have to be aware of is that each of the VDU19s is working on a different colour code.

The VDU19 in line 110 controls the colour code 3, the one in 120 controls the colour code 2.

I leave it up to you to figure out which colour code the VDU19 in line 130 controls.

By using each of the VDU19s in turn to change the palette colour assigned to each colour code we can cause the colours of the text to rotate in sequence.

The FOR... NEXT loop and the MOD operator are just a technique to make sure that only three palette colours are assigned to the colour codes 1, 2 and 3 and that each line has a different colour.

As I said earlier, don't worry too much if the maths that rotates the colours seems a little obscure.

It's quite simple really when you get used to it and will be covered in a future Maths Workout in *Electron User*.

You don't need much maths ability to understand Program IV;

```

10 REM PROGRAM IV
20 MODE 5
30 PRINT TAB(5,2)"HELLO
  THERE"
40 COLOUR 130
50 FOR X=0 TO 19
60 FOR Y=5 TO 28
70 PRINT TAB(X,Y) " "
80 NEXT
90 NEXT
  
```

All that's happening is that the message is being printed

on the screen by line 30. The next line changes the background text colour to yellow and the FOR... NEXT loop prints out a rectangle of yellow squares.

The program is trivial but if you think of the message as a score table and the yellow part as a playing area you might see its application.

The trouble is that printing all those yellow spaces onto the screen is rather messy. Program V shows a rather neater way of achieving the same result.

```

10 REM PROGRAM V
20 PRINT "HELLO THERE"
30 MODE 5
40 VDU 23,1,0;0;0;0;0;
50 PRINT TAB(5,2)"HELLO
  THERE"
60 VDU 19,2,0,0,0,0
70 COLOUR 130
80 FOR X=0 TO 19
90 FOR Y=5 TO 28
100 PRINT TAB(X,Y) " "
110 NEXT
120 NEXT
130 VDU 19,2,3,0,0,0
  
```

What's happened is that the VDU19 of line 60 has assigned the palette colour 0 (black) to the colour code 2. So now anything that is printed in colour code 2 will appear black instead of the previous yellow.

The program then carries on as before printing the rectangle of spaces onto the screen. Only this time they are black, not yellow (because of line 60's VDU1).

Since the background is already black, when we print on it with our black spaces nothing appears to happen.

The Electron isn't bothered though. It knows which part of the screen is the black background (colour code 0) and which parts have had spaces printed on them in colour code 2.

Never mind that both colours are black. To the Electron

some parts are in colour code 0 and some are in colour code 2 and it's not bothered if humans are too thick to know the difference.

Once the Electron has finished handling the FOR... NEXT loops it goes onto line 130.

Here the VDU19 tells it that everything printed in colour code 2 is now to appear yellow (palette number 3). The result is that the yellow rectangle appears as if by magic.

This technique of reassigning a colour code to the background colour, invisibly writing a message on the screen in that colour and then using a VDU19 to make it suddenly appear, can be very effective.

A simple VDU19 can be used to switch parts of a message on and off in a most impressive manner.

The technique can even be used to produce a very simple form of animation, as Program VI shows.

```

10 REM PROGRAM VI
20 MODE 2
30 VDU 23,1,0;0;0;0;0;
40 FOR codeX=1 TO 15
50 VDU 19,codeX,0,0,0,0
60 COLOUR 128+codeX
70 PRINT TAB(3+codeX,15);
  " "
80 NEXT codeX
90 REPEAT
100 FOR codeX=1 TO 15
110 VDU 19,codeX,7,0,0,0

120 FOR pause=1 TO 500
  : NEXT
130 VDU 19,codeX,0,0,0,0

140 NEXT
150 UNTIL FALSE
  
```

There's nothing very hard about it. It just uses all the techniques we've covered in the programs.

Lines 10 to 30 tell us the program number, put the

colour code 1 black	colour code 2 black	colour code 3 black	colour code 4 black	colour code 5 black	colour code 6 black	colour code 7 black
------------------------	------------------------	------------------------	------------------------	------------------------	------------------------	------------------------

Figure II: The spaces and their colour codes

colour code 8 black	colour code 9 black	colour code 10 black	colour code 11 black	colour code 12 black	colour code 13 black	colour code 14 black	colour code 15 black
------------------------	------------------------	-------------------------	-------------------------	-------------------------	-------------------------	-------------------------	-------------------------

micro into Mode 2 and switch off the flashing cursor.

The FOR...NEXT loop in lines 40 to 80 print out 15 spaces in a row. If you look at the VDU19 in line 50 you'll see that by the time the Electron has gone round the loop 15 times, the colour codes 1 to 15 have all been assigned the palette colour 0, which is black.

Figure 11 shows how the 15 spaces are laid out, along with their colour code number.

The trouble is that we can't see them on screen, as the program has arranged for them all to be black. And, unlike the Electron, we can't tell these black spaces from the black background.

So if we can't see it why bother doing it? The endless REPEAT...UNTIL loop of lines 90 to 150 supplies the answer.

This uses two VDU19s in a FOR...NEXT loop to produce the effect of a rectangle moving across the screen from left to right.

The first VDU19 in line 110 gives a colour code (selected by %code%) the palette number 7 (white).

Then, after a short delay, the VDU19 of line 130 makes the same colour code stand for

black again. This is, in effect, switching each space "on" for a short time and then "off".

The FOR...NEXT loop ensures that this happens to each of the 15 spaces in turn and this gives the effect of animation. Figure 111 shows what is happening.

So as you can see, there's a lot we can do with VDU19s to enliven our screen display. You'll only learn by doing.

so have a go at changing Program VI.

Can you make it work in different colours? Is it possible to make it go from right to left as well as left to right?

And is it possible to get the

same effect going upwards?

Try it and see.

And while you're doing that I'll be getting on with the next article, which will explore drawing lines with the Electron.

Figure 111: How the white spaces "move" to the right

**NOW AVAILABLE ON THE ELECTRON
D.A.C.C.'s SPRITE - GEN
Runs in 4 colours Mode 5
PRICE £9.95**

The BBC version of this highly successful package has won a nomination in the 1984 British Micro Computer Awards.

Write your own 'Arcade Action' games with D.A.C.C.

Sprite-Gen

This amazing and revolutionary new piece of software, written for the BBC Model B by Dennis Ibbotson, represents the biggest step forward for BASIC programmers since the release of the BBC Micro itself. It allows you to create multi-coloured, fast moving SPRITES, controlled simply from your own BASIC program. Now you can write the kind of "Arcade Action" games you always dreamed of writing before you discovered that BASIC can't achieve the speeds necessary. Until now, only experienced machine-code programmers could produce "Ghost Gobbling Monsters" and "Light Speed" spacecraft. With SPRITE GRAPHICS all the creatures and objects you can imagine are at your command, moving smoothly at any speed and in any direction you choose. Incredibly, SPRITES can be created using ALL SIXTEEN logical colours - eight steady and eight flashing. And as if that were not enough you animate your SPRITES with individual movements such as "a man who walks", "a bird that flaps its wings", "invaders that pulse menacingly", the possibilities are endless! When you own the SPRITE GENERATOR package you have access to every sort of high-speed animation technique you need. Buying expensive machine-code games may become a thing of the past. Look at the following impressive list of features you can access from your own BASIC programs ...

- Up to 32 SPRITES on screen at any time.
- Limitless SPRITE design using the SPRITE Generator program included in the package, allows ALL SIXTEEN logical colours "in each SPRITE" if desired. Full operating system capability of logical/actual colour assignment.
- There can be up to EIGHT different SPRITE DESIGNS active at one time, each of which can have up to THREE "CLONES", (copies of the primary SPRITE but each with individual movement control).
- Each SPRITE actually has TWO images which given slight differences will achieve the animation effects when the two are alternated. Or, if you choose, give the two images totally different designs and if you have created two SPRITES out of one, usable alternately. This technique can also be applied to the CLONES which means that all 32 SPRITES can be animated, multi-coloured, moving objects!!!
- Once you have completed the design of your SPRITES using the simple grid-based generator utility, they and the high speed machine-code routines that control their movement are secreted into RAM and the BASIC system is ready to accept your own program lines through which you can direct the SPRITES to appear, move, disappear or just remain stationary, with the simplest commands you could imagine.
- SPRITES can be linked together in pairs or groups to produce large scale animation. Of course, if you wish they can be as small as a single pixel.
- Your own creations can move in front of each other with no loss of detail.

SPRITE-GEN is supplied as a package containing:

- *** Sprites-Generator program
 - *** Two 'last-action' demonstration programs
 - *** Sprites-Gen control routines
 - *** Illustrated user manual with examples and listings
- All for only £17.95 (pp and VAT included),
in U.S. \$49.95

**DRAGON, ATARI 400/800, BBC MODEL/B TRS 80 C/C 32K
747 FLIGHT SIMULATOR**

Superbly realistic instrumentation and pilot's view in lifelike simulation which includes emergencies such as engine fires and systems failures. This program uses high resolution graphics to the full to produce the most realistic flight-deck display yet seen on a home computer. There are 21 real dials and 25 other indicators (see diagram). Your controls operate throttle, ailerons, elevators, flaps, slats, spoilers, landing gear, reverse thrust, brakes, etc. You see the runway in true perspective. Uses joysticks and includes options to start with take-off or random landing approach. "A real simulation, not just another game." (Your Comp. Apr. 83).

CASSETTE £9.95 (pp and VAT included). Joysticks optional (except Dragon).
in U.S. \$27.95 (pp included)

(U.K. orders despatched within 48 hours)

Dealer and foreign distributor enquiries now being taken.
Software writers - sell your programs in the U.S. through DACC.

To DACC Ltd., Dept. EU, 23 Waverley Road, Hindley, Wigan, Lancs. WN2 3BN.

Please rush me:

- ___ qty. SPRITE-GEN at £17.95 each (BBC Model/B only)
- ___ qty. SPRITE-GEN at £9.95 each (Electron only)
- ___ qty. 747 FLIGHT SIMULATOR at £9.95 each (late machine)

Electron Software

BUSINESS
& LEISURE

From
GEMINI

Business Packs - £19.95 per program

INVOICES & STATEMENTS

This program greatly reduces the time and cost of preparing Invoices and Statements by storing essential information such as customer names, addresses and account numbers, VAT routines and footer messages such as 'Please remit by return', 'Overdue and outstanding', etc.

Not only are Invoices and Statements produced more quickly and accurately, but pre-printed forms for them are eliminated since the program produces professionally formatted documents using your own printer.

Games

Missile Control

£9.95

Widely acknowledged by the trade and press as being the definitive version of this arcade classic for the Electron. Stunning graphics and as many screens as you can manage. Joystick or keyboard, 4 player option, smart bombs, planes, satellites, demo mode, hi-score, it's all in this one!

Traditional Games £14.95

Consists of ACCORDION, GIN RUMMY, PIQUET and BACKGAMMON

Using the full potential of the Electron's colour graphics, these games allow the user to achieve a sound level of competence against a reasonably proficient opponent...THE COMPUTER!

The full and comprehensive manual, contains detailed rules for playing, plus hints on how to improve your play... until you can consistently beat the computer, at which point you should be ready to take on most players for modest stakes!

1 DATABASE

The Gemini Database is a program designed to enable the user to store all types of information in similar format to a card indexing system. Information may be stored under your own defined headings, and the Gemini Database contains other important facilities such as alpha and numerical sorting, calculations, finding records that meet specific requirements, line printer routines, browsing, etc. An invaluable first 'serious' program for any Electron user.

SPREAD SHEET ANALYSIS

Perhaps the most commercially successful item of business software yet written, the Spread Sheet processor offers a very wide range of invaluable calculation and editing features. Consider, for example, a Cash Flow forecast containing rows and columns of figures, combined with text and numbers. If, say, the cash receipts for January need to be changed, it would normally be necessary to delete and re-calculate several figures for each successive month.

With SPREAD SHEET, however, an 'on screen' amendment to the January figure is made, and the corrected figures for each successive month automatically appear upon touching the 're-calculate' key.

Formulae cells in the table may be specified which relate to each other and then copied RELATIVELY or ABSOLUTELY to other parts of the program, which is itself in modular, and directly linkable to other Gemini programs.

The sister program GRAPHPLOT will take data from disk or tape files created by this program to provide data portrayal in graph, histogram or pie chart format.

GRAPH PLOT

Written specially for use with the Electron, this program makes full use of the high resolution colour graphics to provide an easily assimilated visual representation of numerical data. For example monthly sales statistics comparing two year's results may be instantly converted into two side by side pie charts, histograms or graphs... for easier visual comparison and assimilation.

GRAPHPLOT also incorporates a built-in machine code screen dump, enabling a high resolution printed image to be produced using an Epson or similar dot matrix compatible printer. It also interfaces with other Gemini programs such as Spread Sheet Analysis and is particularly recommended where any kind of mathematical plotting facility is required.

WHY GEMINI? With three years experience in producing superb software for the BBC Micro, Gemini are a natural choice in selecting the best programs for your Electron. All our Serious Software is supported by prompt technical help and advice by phoning (0395) 265165, and supplied with professional quality manuals, whilst Gemini's board of Directors includes three Chartered Accountants.

MAILIST

A superb dedicated database to allow for manipulations of names and addresses and other data. Gemini's unique 'searchkey' system gives you a further ten 'user-defined parameters' to make your own selections. Features include the facility to find a name or detail when only part of the detail is known, it will print labels in a variety of user specified formats.

EASILEDGER

Contains routines to enable the small businessman to keep a record of one of the most important aspects of his business—cash flow.

EASILEDGER is essentially a debit/credit ledger system which can handle sales, purchase and normal ledger routines to provide instant management information. Its flexibility lies in its ability to produce account balances instantly for debtors and creditors, together with a record of all transactions, dates and references. A year-to-date summary of sales, purchases, receipts and payments over the twelve month period is also provided as is a complete INTERACTIVE bank account database.

STOCK CONTROL

Dedicated software with all that's necessary to keep control of stock. This program will take the tedium out of stock control and save time and money. Routines include stock set up, user reference number, minimum stock level, financial summary, line print records, quick stock summary, add stock, delete/change record and more.

HOME ACCOUNTS

Designed as a complete Home Accounting package this program allows the user to set up a budget for items of household expenditure and compare actual expenditure with budget. A running total of all surpluses and deficits is available both as digits, and in the form of a bar chart.

A complete Bank account routine is included together with suggested expenditure categories such as mortgage, rent, rates, telephone, gas, electricity, etc. however, these may be deleted or augmented without difficulty.

Available from most good software dealers and larger branches of WH Smith and Boots, or phone Gemini for immediate despatch quoting your Access, Visa or American Express card number.

Telephone (0395) 265165. Alternatively send your cheque or Postal Order made payable to: Gemini Marketing Ltd.

Please send urgently:

18a Littleham Road, Exmouth, Devon EX8 2QG England.

ADVENTURE £7.95
 Explore the tortuous forests, dark caverns, and castle dungeons to rescue the Princess and carry off untold treasures. Use skill and imagination to visit over 100 locations and solve the baffling puzzles. An intriguing and frustrating text-only adventure.

INTERGALACTIC TRADER £8.95
 Beat the competition to Orion with valuable ore mined from your string of asteroids and become a multi-millionaire. Determination and cunning are required to stay ahead of the the field in this exciting strategy game for 1 to 9 players. Complete with a comprehensive manual.

ELECTRON INVADERS £7.95
 Leave the safety of the bunkers to fire at the Delerian attack force flying overhead. Take careful aim between the craft to obliterate the orbiting mothership. But watch out for the bombs which explode in mid-air and spray the area with shrapnel.

GALACTIC COMMANDER £7.95
 Land with precision at the nine different Xenon bases to receive the ultimate accolade. Features underground landing sites and an eventual encounter with the dreaded Floops.

AVAILABLE FROM ALL GOOD DEALERS INCLUDING
 BOOTS JOHN MENZIES AND WH SMITH

Other top titles for the Electron include:
 Killer Devils £7.95; Bandits at 3 o'Clock £8.95; Moonrider £7.95; Croaker £7.95;
 Felix in the Factory £7.95; Felix and the Fruit Monsters £7.95; Chase £7.95; Draw £9.95;
 Escape from Moonbase Alpha £7.95; Cybertron Mission £7.95; Sword £7.95.

All Electron programs (except Electron Invaders) are also available for the BBC Micro.

PROCEDURES

370 PROCinitialise	Defines the characters used – a coloured circle, a white peg and a black peg. Sets up the arrays used, switches off the Escape key and cursor keys, redefines the Break key.
230 PROCinstructions	Prints the instructions.
490 PROCset_variables	Sets the difficulty level.
590 PROCprint_board	Draws the grid, prints the title and colours used.
790 PROCset_code	Sets the secret code.
850 PROCinput_guess	Allows you to type in your guess. Only the colours up to and including level are allowed. As long as there is one colour present you can use Delete. Guess() stores the colours.
1030 PROCcheck_guess	Marks the blacks first. Stores whether a colour in the answer or your guess has been marked or not. Leaves if all five colours are right. Marks the whites. A white peg is given only if neither the answer nor your guess has been marked before.
1300 PROCgot_it	Flashes the title and makes a

sound. Calls PROCdisplay_answer to confirm that it is correct.

1400 PROCfailed	Prints FAILED, makes a low sound, calls PROCdisplay_answer to show what it was.
1630 PROCanother_game	Asks if you want to play again.
1800 PROCtidy_up	Restores the cursor keys and Escape key.
1740 PROCpause(delay)	Waits for the length of time in the brackets.

VARIABLES

code()	Stores the secret code.
guess()	Stores your guess when you type it in.
marked_answer()	Stores whether a colour in the code has been marked or not.
marked_guess()	Stores whether a colour in your guess has been marked or not.
correct	TRUE if you have cracked the code.
guesses	The number of guesses made.
level	The difficulty level – the number of colours used.
i	Used as a counter in loops.
colour	The colour printed and placed in guess().
keys	The key presses when asked if you want to play again.

```

870 guesses=guesses+1      1070 NEXT i

This listing is included in this month's cassette tape offer. See order form on Page 47.

A joy to use...

THOUGH few of us admit it, most people buy a home micro for two basic reasons – either to learn to program, or to play games.

It's because of this that Signpoint's Joyport is potentially the most useful interface developed for the Electron that I have come across.

Before you all jump from your chairs and wail about spreadsheets, home accounts, recipe programs and the like, let me explain.

To communicate with the outside world (*that means YOU*) the micro needs some kind of interface, such as the keyboard.

You "talk" to the programs through the keyboard. Whether you need to hammer the spacebar or type in thousands of figures on the Electron, you must use the keyboard.

Fine so far, but what if you can't type or you don't have good use of both hands? Or if you want pinpoint accuracy to move a cursor to within a fraction of an inch of a point on screen?

That's where a joystick comes in handy.

Like it or not, the joystick is a very useful piece of hardware. Unfortunately, the standard Electron doesn't have the ability to handle joysticks.

This is where the Joyport comes in.

Housed in a neat little plastic box, the unit hangs piggyback-fashion on the Electron's expansion bus. This is the piece of printed circuit board that emerges from the back of the micro.

I say "hangs" because the unit is supported solely by its connection to the micro, reminiscent of the early Sinclair computers.

This, of course, means that a micro with a Joyport is a bit tricky to sit on your lap. Don't forget though, this is a micro –

not the pet cat!

The Joyport has been wired to accept most of the Atari type switched joysticks. This is very much in its favour since:

- Switched joysticks are probably more suitable for playing games.
- A wide range of switched joysticks is available.
- Switched joysticks start from about £10 upwards for a single unit.

The documentation supplied with the Joyport is adequate, though some people may find the printing a little small to read.

A nice touch is that the manual gives complete modifications to some of the programs on the Welcome tape, enabling them to be controlled with a joystick.

One point not made clear in the manual is that you must turn the Electron off before you insert or remove the Joyport. Otherwise damage may result to the computer and/or unit.

If by now you're wondering what the catch is, the answer is simple. As yet very little commercial software is compatible with the Joyport.

However Signpoint have got the solution. A simple assembly language program, supplied as a listing with the package, shows how to patch many commercial games to the unit.

In conclusion, the Joyport is a terrific piece of hardware and well worth the money.

But before you go and buy one, remember you will be lucky if it's compatible with all of your commercial software.

This however is a problem that will face all joystick interfaces for the Electron and doesn't detract from an impressive piece of equipment.

Marcus Adams

... now test it yourself

THIS game is designed to be a simple demonstration of the Joyport at work. However, if you haven't got one you can still play it by using the keyboard.

What you have to do is to kill the spacemen with the laser as fast as possible.

The laser is aimed using the + shaped cursor, which is moved around the screen using either the joystick or the keyboard.

MAJOR INTEGER VARIABLES

- X%** Present X coordinate of cursor.
- Y%** Present Y coordinate of cursor.
- x%** Last X coordinate of cursor.
- y%** Last Y coordinate of cursor.
- mx%** Present X coordinate of man.
- my%** Present Y coordinate of man.
- on%** How many turns spaceman has been on screen for.

SPECIAL VARIABLES

- left** Number returned by the Joyport if stick moved left.
- right** Number when stick moved right.
- up** Number when stick moved up.
- down** Number when stick moved down.
- fire** Number when fire button pressed.
- loc%** The location to PEEK (?) to get the value from the Joyport.

PROCEDURES

- PROCplot** Moves cursor to new X,Y coordinate.
- PROCinput** Gets value from joystick.
- PROCkey** Gets value from keyboard.
- PROCshoot** Prints "laser burst" and checks for hit.
- PROCmoveman** Decides whether it is time to move the spaceman. If it is then moves him.
- PROCinit** Initialises the start of play.
- PROCman (X%,Y%)** Plots spaceman at X,Y coordinate.

This listing is included in this month's cassette tape offer. See order form on Page 47.

What are aliens made of?

THIS month we'll be looking at *Alien*, a program sent in to us by Christopher Skelsey. It draws a weird-looking spaceman on the screen using the VDU23 user-defined characters we've come across in *Casting Agency*.

However it goes one step further, in that the spaceman is multicoloured. Type in the program, run it and see for yourself. Let's find out how it works.

Lines 10 and 20 are the usual REM statements. These mean nothing to the Electron but tell us what the program is called and who wrote it.

Line 30 selects Mode 2, the sixteen colour mode, while line 40 tells the Electron to print

characters in COLOUR 2, which is green.

The basic outline of our alien is made up of nine user-defined characters. These are defined in lines 50 to 130 and their positions are shown in Figure 1.

Lines 140 to 170 use VDU23 to define four more shapes, but for the moment we'll ignore these and pass onto the PRINT commands in lines 180 to 210.

These use the TAB command to place the nine user-defined characters we saw earlier on the screen in the shape of the alien.

If you want to prove this to yourself run the program leaving out lines 140 to 170 and any after 220. This will show

you what the remaining lines do.

Don't, however, go to the bother of deleting the lines you don't want. After all, if you get rid of lines 140 to 170 you'll have to type them in again later if you want the program to work properly.

But there is a simpler way - a tip I got from the editor of *The Micro User*.

If you want the micro to ignore a line (which is usually when you're trying to figure out what that line contributes to the program) just use the Copy key to copy that line and put a REM after the line number.

So if you want to see what the effect of leaving out line 140 is, just copy:

```
140 VDU23,233,0,0,0,0,
    0,0,0,36
```

and put in a REM as in:

```
140 REM VDU23,233,0,0,
    0,0,0,0,36
```

Now the Electron will ignore that line when the program is run. If we want to use it again we just re-copy it leaving out the REM and the line will work.

This saves a lot of typing and can be quite a useful guide as to what a line is doing in a program.

The rule is, if you're not sure what it's doing there, REM it and see what happens when the Electron ignores it.

Anyway, back to the *Alien*. We've got as far as line 220, which sets the foreground text colour to flashing red.

This puzzles me as I can't figure out where it is used. Try REMing it and see if you can. I've left it in "for possible future expansion".

Line 230 takes us into a whole new dimension of user-defined graphics by joining the text and the graphics cursor.

This allows us to use the graphics commands of the

Software Surgery

THE COLUMN THAT TAKES A LOOK INSIDE THE LATEST RELEASES

For once you can afford to be a loser

Horserace

Dynabyte Software

ARE you a betting man? Do you hate losing money? Then there's the perfect answer in a game called Horserace.

Allowing up to six players, it gives all the excitement of a day at the races without risking the cash.

A totaliser showing the betting possibilities, plus a betting slip, flash on your screen.

All you have to do is choose your horse and state how much money from your £1,000 you wish to place, press the space bar and you're away.

The graphics are particularly striking, with flags, a grandstand, waving crowds and even jockeys tumbling

Place your bets - and away they go!

from realistic horses. It's usually your jockey!

The first three horses past the post are printed on a tote board near the stand and an all-too-accurate check is also kept on your financial position.

But never mind, you can afford to be rash - just this once.

Alan Turner

Into battle

Johnny Reb

Lothlorien

HAVING never before tried a war game (is this the right term?) it was with some trepidation and not a little interest that I loaded Johnny Reb.

However I think I could quite easily get addicted now!

The object is to select an army of your own devising and, by out-maneuvring a second player, or the Electron, capture the enemy army's flag a predetermined number of times.

The scenario is a confrontation at a river crossing during the American civil war.

The program, which is recorded on both sides of the cassette, loads in two parts.

The first plays 'Dixie',

displays the Confederate flag and loads in the main program.

You are then given various options - one or two player game, whether you want to be the Johnny Rebs or the Blue-bellies, what units you want in your army, if you want a time limit and if so, what?

You can choose to play a friend or, by choosing the one player option, the computer.

Your army can consist of up to 20 units of each of cavalry, infantry or artillery.

If you are playing the computer it can choose a force numerically equal to yours but not necessarily consisting of the same number of each unit.

When you have made your choices the battleground is displayed.

This display and the placement of troops on it, is random. But I noticed a tendency for the Electron's army to keep being slightly more favourably placed than mine!

Each army in turn makes a move for each of its pieces. After one complete move by each army the battleground is scanned and updated.

The first army to capture the enemy army's flag a certain number of times - or alternatively to destroy all the enemy - wins.

So what is it like to play? Well, it's like playing a cross between toy soldiers and chess.

If it seems that the enemy

will get you, you can always give them a blast from a cannon.

I found I liked to play with the maximum number of pieces (60), without a time limit.

If you are called down for tea there is a save-game facility.

Enclosed with the program is a cassette-sized leaflet containing seven pages of rules. But I found the program very user-friendly, causing only occasional reference to the instructions.

Some things I didn't like. My major complaint is that the more I played it the slower it seemed to get.

After completely exterminating the enemy army (my one and only time) it took about half a minute, while the program scanned the enemy battlefield for troops and then again for score-checks, for it to announce that I had won.

Another thing I'd like to see changed is the method of calling the save-game routine.

I found myself calling it up several times by inputting 'S'

(save) when I had meant to input 'M' (move). Return 'S' (SOUTH).

Perhaps if you had to type in SAVE this problem wouldn't arise. The error-trapping on the Break key didn't seem to be quite right, but that probably serves me right for messing about with it.

Overall, a little on the slow

From Page 35

side. Nevertheless it's a compulsive game that will keep your interest longer than the average arcade game.

And it will still be going strong when you have solved that latest adventure. Good value for money.

Merlin

Down on the farm

Corn Cropper
Cases Computer Simulations

AN unusual new game for those older ones among you who fancy taking all the decisions. Corn Cropper can really grab your attention.

It brings all the harrowing (sorry!) decisions involved in running a farm into your front room. But don't be deterred!

There are five levels of difficulty. The higher the level, the greater the adversity. So start at the lower levels.

The object of the exercise is to increase your initial assets of £50,000 to £250,000 over 55 months.

You are asked to take decisions as to planting, irrigation, harvesting and selling.

You are not on your own though. To help you make decisions, the Electron gives generous monthly bulletins on the weather, crop progress and your cash flow situation.

All in all, a challenging program with a nifty rendition of "The Archers" tune to boot! Hope that doesn't put you off.

Keith Wilmot

Mission from Camelot

YET another superb adventure from Epic. This time you aspire to join King Arthur's round table at Camelot.

Unfortunately it is not quite as simple to join as you thought. In fact Arthur decides that you will have to perform a deed of valour to prove your worthiness.

After much deliberation he decides that the task you will have to perform is to find and return the Holy Grail.

To this there are gasps of amazement from the assembled knights and one even shouts "Impossible!"

How right he is! I've been trying for the last two weeks so I should know!

You start your quest on a hilltop outside Camelot. Your first task is to explore the surrounding forest.

You will find various objects scattered around here and two very annoying knights who won't actually attack you but do insist on refusing to let you pass.

Quest for the Holy Grail
Epic Software

You eventually come to a large tree. You can climb it with a ladder and a plank (hint!) and even fall partway down through the branches before climbing down to the ground.

But unless I'm missing something, you can't then climb back up it!

Your next task is to find your way through the swamp. Here the save game facility is a life-saver, literally!

Once through the swamp you have another one of those knights to thwart. But providing you have successfully investigated the surrounding countryside you shouldn't have any real problem here.

Once the knight is vanquished you have a magnificent castle to explore, complete with dungeons, secret passageways leading to mysterious and distant

locations and doors that refuse to open.

I shan't tell you any more about the adventure - I couldn't if I wanted to. This is where I got stuck!

Suffice to say that there are about 230 locations, of which I visited about 100, a maximum possible score of

Action - with logic

Seawolf
Optima Software

SEAWOLF from Optima Software is a new kind of war game, combining logic with action.

You set about destroying the enemy fleets in the submarine Seawolf, trying your best not to get wiped out in the process.

You can start off as a rating, where the enemy (bless his sporting heart) gives you a run for your money, and end up as a captain, where the enemy (the swine) will try and squelch you as soon as you poke your nose outside the base.

The game has two phases. The first is the long range scan where you select your target from the fleet.

The second phase is where you line up the target in your sights and let fly with either torpedoes or lasers.

An average Seawolf target can absorb about 12 hits from torpedoes, and half as many from the lasers before becoming a kill.

All the time you're attack-

ing, if the target is a warship you are sustaining damage from his counterattack. The kills accumulate, and 15 is a completed mission.

Unfortunately the damage accumulates as well and 100 per cent means curtains.

You can, however, return to base between attacks if you so wish and "zeroise" the damage.

That way you are certain to successfully complete the mission, but at the same time almost "zeroise" any excitement.

Choosing "soft" civilian targets is an easy way of ending up with 15 kills.

I did this quite often (I suppose you could say I'm just a sheep in Seawolf clothing.)

Anyway, Seawolf is slightly different, but I thought only just above average. Available graphics are under-utilised,

and I would have liked to see more colour used.

Also more imagination could have gone into representing the target ship - whether it be a tanker or a battleship, the image is exactly the same.

Having said that, if you want a war game that is out of the ordinary and isn't just zapping aliens then Seawolf will fit the bill.

Derek Schofield

8,000 (I got 2,000) and about 140 words recognised by the program.

The puzzles are superb and I think praise is due to the program's writer.

As is usual with Epic, a small cassette insert gives general instructions and a synopsis of all their other adventures.

The game loads in three parts. The first program displays the Epic logo and produces a merry little tune.

The second gives background information on the scenario, with some simple commands to get you started and then loads the main program.

Overall, while I wouldn't recommend it to an absolute beginner, it is a superb adventure and excellent value for money. Compulsive!

I think having now tried all three of the Epic adventures, that they must be the yardstick by which all future adventures for the Electron should be judged.

P.S. If anyone gets those doors open, please let me know how you did it!

Merlin

Into real space

Space Shuttle
Microdeal

EVER wondered what it must be like to sit atop several million pounds of thrust as it blasts you skywards toward a minute hole through which you must pass?

Ever thought how difficult it must be trying to link up with an object the size of an armchair in the vast emptiness of space while both of you are hurtling around the earth at 17,000 miles an hour?

What goes through your mind as you pilot the world's biggest and most expensive glider toward a minute strip of tarmac, knowing that you'll only get one chance, balancing height and speed to make a good or disastrous landing?

Stop wondering. Cease thinking. Put yourself out of your misery. See for yourself.

Microdeal has got it all on cassette. Space Shuttle

encompasses all these things.

You lift off and pilot the shuttle toward a small "window" to achieve a successful orbit near a satellite you have to reclaim.

Your progress is plotted on a screen on your instrument display board.

Once successfully established in orbit you dock with the satellite and retrieve it with your mechanical arm.

Retro fire slows you down and you re-enter the earth's

atmosphere and pilot the shuttle down to the landing strip.

Easy, hey? Just you try it! One millimetre out on blast off or re-entry and you rendezvous with neither the satellite nor landing strip and no points are scored.

A mite too heavy with your thrusters on docking and you end up spinning out of control or crashing into the satellite - with no points.

Fail to balance your height and speed correctly on approach and you end up as yet another crater - again no points.

The easiest part is picking up the satellite with the shuttle's arm. Sad to say, these are often the only points I can pick up, and I've been at it for ages.

For your money you get a full instrument display, a panoramic view through your windscreen and an extremely interesting and absorbing game.

Any section at which you fail is aborted and the next section is started, so you always complete the game, even if you're a complete

Fastest game in the Galaxy...

OMEGA PROBE
Optima Software

TIRED of solving adventure games? Fed up with educational programs and glutted with amazingly boring utilities?

Well why not go back to where it all began and zap aggressive aliens from a far off galaxy? And when you do, make sure that you have a go at Optima Software's latest Electron game, Omega Probe.

The scenario is fairly familiar. You are in command of a drone ship investigating the Omega sector, the last great space frontier.

The local aliens look on you as a hostile force and launch a mass unprovoked attack. You have to defend yourself as best

you can.

What is unfamiliar is the speed. It's the fastest game for the Electron that I've come across so far. The aliens come at you thick and fast, sliding across the screen.

Wasters, Ouchers, Pursuit and Interceptor Drones hurtle at you as you do your best to evade and fight them off. The graphics have to be seen to be believed.

The controls are well designed and easy to use. You even get the choice of using joysticks, both the Signpoint Joystick and the First Byte joystick interface work with the game.

This adds a whole new dimension to the game (if that's possible).

It is engrossing and compulsive, the kind of game that you see someone playing and immediately want a go yourself.

And if it's you that's playing you don't want to let anyone else have a go. Recommended.

Alan Coombes

"no-no" like me.

On the minus side, the game is in black and white, and I found the music in between the games a bit tedious.

You can't turn it off without BREAKING the program. If you want 10 minutes peace and quiet you have to reload the game before restarting.

But don't let that put you off. It is a game well worth buying.

KEEP ON SMILING

DRAW that familiar smiling face on the screen and display the message of your choice with Smiler by M. PHILLIPS and A. GOLDEN.

By making repeated use of two procedures this short graphics program draws circles and semicircles of differing sizes at different places on the screen.

Clever timing even makes Smiler appear to wink. If you want a different message, just put it between the inverted commas of line 160.

Have a Nice Day!

- 10-30** REM statements making comments.
- 40-70** These lines set the screen mode. Text is made to appear in red, the graphics colour set to yellow. The flashing cursor is switched off.
- 80-150** This is the part of the program that makes repeated use of procedures to make up Smiler's face.
- 160-180** Puts up the message and make the program loop to prevent the cursor re-appearing.
- 190-280** Lines defining PROCCIRCLE, which is used to draw circles of differing sizes representing the

faces and eyes. The X and Y parameters are the graphics coordinates which position the circle. Its radius is controlled by R while its colour is yellow if D is equal to 5 and black if it's equal to 7.

- 290-380** The procedure which draws the semicircles for the smile.
- 390-470** Draws a circle from the bottom to the top of the left eye, producing the wink.
- 480-500** As you might guess, this is a procedure that causes a delay.

FIRST BYTE

ELECTRON JOYSTICK INTERFACE

ELECTRON JOYSTICK INTERFACE

Electron users! This is the add-on everyone wants...it's the new Electron switched joystick interface from First Byte™, available now with free conversion tape that vastly extends your game range right away.

The interface operates with all 'Atari-style' 9-pin joysticks, and its many advanced design features put it way out in front for quality and reliability. That's why, to date 15 major software houses are already bringing out games that work directly with the First Byte Electron Joystick Interface - and many more are sure to follow.

FREE conversion tape - play all these top games right now

Every Electron Joystick Interface comes with a free conversion tape, so you can use some of the most popular games around right now:

- | | | |
|------------------------------|------------------|--------------------|
| ● Killer Gorilla | ● Kamakazi | ● Lunar Rescue |
| ● Moonraider | ● Chuckie Egg | ● Bugblaster |
| ● Positron | ● Atom Smasher | ● Blagger |
| ● Croaker | ● Alien Break In | ● Bed Bugs |
| ● Swap | ● Birds of Prey | ● Alien Dropout |
| ● Bandits at 3 o'clock | ● Galaxy Wars | ● Daredevil Dennis |
| ● Escape from Moonbase Alpha | ● City Defence | ● Sneaker |
| ● Cybertron Mission | ● Monsters | ● Diamond Mine |
| ● Cylon Attack | ● Pool | ● Vortex |
| | ● Penwyn | |

The conversion tape also allows you to configure most other games for joystick control.

Games specially for the First Byte Interface

All these major software houses are bringing out games that work with the First Byte Electron Interface, with no conversion tape needed.

- | | | | |
|-----------------|------------|------------|---------------------|
| ● Alligata | ● Romex | ● Aardvark | ● Software Invasion |
| ● A & F | ● Bug-Byte | ● Optima | ● MRM |
| ● Program Power | ● Visions | ● Poslern | ● Beebugsoft |
| ● Supenor | ● Virgin | ● Phoenix | |

The First Byte Electron Joystick Interface - available now from all good dealers and W. H. Smith.

Look at these advanced design features.

Works with all 'Atari-style' 9-pin joysticks and utilises rapid-fire mode on Quickshot 2.

Only 2 chips for ultra-high reliability and low power consumption ensuring safe operation with the Electron.

Custom-built, colour-co-ordinated case in high-impact plastic. Special fittings ensure that when the joystick is plugged in, the case takes the strain, not the soldered joints.

Gold plated connectors ensure a perfect contact. Metal polarising key and nylon end caps ensure positive locking.

Little Brothers should be seen but not heard.

A maxim which eloquently describes the Brother HR-5.

Less than a foot across, it's nonetheless loaded with features.

But there's one thing the HR-5 won't give you. Earache.

For the annoying 'clickety clack' many printers produce is mercifully absent from the HR-5.

Quietly efficient, it delivers high definition dot matrix text over 80 columns at 30 c.p.s.

The HR-5 also has something of an artistic bent.

Being capable of producing uni-directional graph and chart images together with bi-directional text.

It will also hone down characters into a condensed face, or extend them for added emphasis.

Incorporating either a Centronics parallel or RS-232C interface, the HR-5 is compatible with

most home computers and popular software.

Perfectly portable, the battery or mains operated HR-5 weighs less than 4lbs, and has a starting price of only £179.95 (inc.VAT).

Which is really something to shout about.

PLEASE SEND ME MORE DETAILS OF THE REMARKABLE BROTHER HR-5 PRINTER.

There's just a ghost of a chance you'll manage to whip round ROLAND WADDILOVE's Money Maze without getting caught...

MONEY MAZE AND RUN

RUN through the maze, picking up as many coins as you can, but watch out for the three ghosts who will try to eat you!

If you manage to collect all the coins then the maze is filled again and the ghosts move faster.

Use the following keys to move:

- A = up
- Z = down
- < = left
- > = right.

Press the space bar to start. Make sure the Caps Lock light is on.

Full listing starts on Page 57

PROCEDURES

- 1670 PROCinitialise** Defines the characters and the envelopes. Sets up the arrays, switches off the cursor keys and the Escape key. Speeds up the auto repeat.
- 230 PROCinstructions** Prints a few notes about the program.
- 1240 PROCdraw_maze** Draws the maze, looks at each character printed and selects the appropriate colour.
- 1520 PROCset_variables** Sets the starting positions and initial delays for the man and ghosts.
- 1080 PROCstart** Prints the man and ghosts. Sets the delay for the man and ghosts. Selects the colour for the maze.
- 380 PROCmove_man** Only if there is not a wall in the way. Checks if he has run into a ghost. Checks if he has picked up a coin. If it was the last one, calls PROCstart to start a new screen.
- 580 PROCmove_ghosts** If sufficient time has elapsed then moves the ghost by passing the parameters to PROCghost.
- 640 PROCghost** Finds out which way to move. Moves only if there is not a wall in the way. Checks to see if the man has been caught.
- 750 PROCanother_game** Makes a sound. Flashes GOT YOU at the bottom. If the

- 970 PROCi_score**
- 1970 PROCtidy_up**

score is the best so far then calls PROCi_score. Asks if you want to play again. Allows you to type in your name. Restores the auto-repeat, cursor keys, and Escape key.

VARIABLES

- maze\$()** Stores each row of the maze.
- ghost%()** Stores the ghost positions - x,y,x,y for the three ghosts.
- gtime%()** The ghost is moved when gtime%() is less than TIME.
- gdelay%()** The delay before each ghost is moved.
- best%** Best score so far.
- mtime%** When TIME is greater than mtime% the man can be moved.
- mdelay%** The delay before the man can be moved.
- manx%, many%** The man's x,y coordinates.
- newx%, newy%** Temporary x,y coordinates for the man or ghost.
- score%** Score.
- caught** Whether the man has been caught or not.
- n%, i** General variables, used in loops.

IMPROVEMENTS/MODIFICATIONS

mdelay%, gdelay% Alter these to change the speed of the game - the smaller they are the faster the initial speed. These decrease with each new maze. Alter the step with which they decrease each time.

No need to tax your brain over prices. Just use this program to . . .

ADD VAT

THIS simple but useful program from SIMON JAMES of Workington, Cumbria works out the VAT price for an item.

As Simon says: "I have used this program to help my father check the VAT prices in our family menswear shops. He still insists he can do it better in his head . . . so much for the computer age".

Can you work them out faster than the Electron? Why not try it and see?

BBC/ELECTRON ADVENTURES

NEW WOODLAND TERROR £7.48 (CASS) £10.50 (DISC)

The sequel to FRIENWOOD, many years ago an intrepid adventurer embarked on a quest for the Golden Bird of Paradise. Although successful, our hero released a sinister force which now lurks within the enchanted wood. Your mission is to return the terror to its original resting place and restore peace to an unhappy land!! This is a complete game, knowledge of Frienwood is not required.

FRIENWOOD £7.48 (CASS) £10.50 (DISC)

An evil wizard has captured the magic golden bird of paradise and imprisoned it in a weird castle in the middle of the enchanted Frienwood. Your quest is to find the bird and set it free, in return the bird will give you health and prosperity. BEWARE! many perils lie before you and every move is fraught with danger!!

BLUE DRAGON £7.48 (CASS) £10.50 (DISC)

Somewhere in a strange and dangerous land lies a fabulous treasure guarded by a fierce dragon. Can you survive the perils that await and recover the treasure or will you meet a nasty end!! What is making terrible slurping noises deep underground and what use is the strange black cloud? Play the game and find out.

SURVIVOR £7.48 (CASS) £10.50 (DISC)

The year is 1910 you are sailing on a steamer bound for Borneo when there is an explosion and the ship sinks. Shipwrecked on a tropical island can you survive and escape back to civilisation, or will you end up in someones cooking pot!! There is more than one ending to this game, not all of them bad!

All the games are in machine code for fast responses and are text only. Please state which machine when ordering. Prices include VAT and postage within U.K. Cheques payable to MP SOFTWARE or write/phone with your ACCESS/VISA card No. Send S.A.E. for full range of programs and price list or ask your local dealer. Trade enquiries welcome.

We pay well for good original programs contact us today for more details.

SOFTWARE & SERVICES

165, SPITAL ROAD, BROMBOROUGH, MERSEYSIDE L62 2AE. 051-334 3472

ELECTRON EDUCATIONAL SOFTWARE

Our educational software is used in thousands of schools and homes throughout Great Britain. Now available on Electron.

EDUCATIONAL 1 £8.00

Hours of fun and learning for children aged 5 to 9 years. Animated graphics will encourage children to enjoy maths, counting, spelling and telling the time. The tape includes MATH1, MATH2, CUBECOUNT, SHAPES, SPELL and CLOCK.

... "An excellent mixture of games" ...

Personal Software - Autumn 1983.

EDUCATIONAL 2 £8.00

Although similar to Educational 1 this tape is more advanced and aimed at 7 to 12 year olds. The tape includes MATH1, MATH2, AREA, MEMORY, CUBECOUNT and SPELL.

FUN WITH NUMBERS £8.00

This program will teach and test basic counting, addition and subtraction to 4 to 7 year olds. The tape includes COUNTING, ADDING and an arcade type game to exercise addition and subtraction. With sound and visual effects.

FUN WITH WORDS £8.00

Start your fun with alphabet puzzle, continue your play with VOWELS, learn the difference between THERE and THEIR, have games with SUFFIXES and reward yourself with a game of HANGMAN. Complete with sound and graphics. The tape includes ALPHA, VOWELS, THERE, SUFFIXES and HANGMAN.

... "Very good indeed" ... A&B Computing - Jan/Feb 1984.

JIGSAW AND SLIDING PUZZLES £7.95

There are 2 jigsaws and 4 sliding puzzles on a 3 x 3 and 4 x 4 grid. Each program starts off at an easy level to ensure initial success but gradually becomes harder. It helps children to develop spatial imagination and in problem solving. The tape includes 6 programs: OBLONG, JIGSAW, HOUSE, NUMBERS, CLOWN and LETTERS.

electron user

Be one of the first to get each issue

A subscription will ensure you get your own personal copy **HOT OFF THE PRESSES** month after month for the next year.

Every owner of an Electron – and everyone thinking of buying one – needs to get *Electron User* every month. It's the brightest, most authoritative yet completely independent guide to a machine that has so much potential you will never tire of reading about its remarkable capabilities.

You can buy *Electron User* from your local newsagent or station bookstall. Or you can take out a 12 months subscription and have it delivered to you by post.

Complete set of our first four issues for only £2.00

Your Electron needs protecting!

Protect your Electron with our luxury dust cover made of soft pliable water-resistant vinyl, bound with strong cotton and decorated with *Electron User* logo.

£3.95

Copies of all issues from February 1984 are still available at £1.25 each

Keep your collection of *Electron User* complete with these handsome binders

Bound in attractive red pvc with the *Electron User* logo in gold blocking on the spine, this binder will hold 12 magazines firmly secured in place by metal rods. **£3.95**

FREE

Cassette worth £3.75 if you subscribe NOW!

If you take out a subscription to *Electron User* now you will receive completely free one of the monthly cassettes of *Electron User* listings. Choose which one you want from those illustrated below.

This free gift is for a limited period, so subscribe now!

Cassette tapes of *Electron User* programs

Save typing in programs from *Electron User* by sending for these program-packed tapes.

£3.75 each

You can also take out a subscription for the 12 monthly tapes for £40.

WIN

this superb add-on!

ELECTRON USER
FREE CONTEST

The first combined printer interface/user port is your prize in this month's competition

HAVE you ever had one of those days when everything seems to go wrong? Well here at *Electron User* we seem to have had a bit of midsummer madness.

We were sorting through some of our old tapes, seeing what was on them, when we came across the following:

```
10 REM 3D-PLOT
20 REM RIPPED OFF FROM
30 P."Dear Santa,"
40 DIM XPOSZ(9),YPOSZ(9)
50 #FX202,48
60 MX=1
   :CX=3
70 PROCWHICH(SIDE(0))
80 REM *** READ X CO-ORDINAT
   ES ***
```

Weird, isn't it? As far as we can tell, each line is correct but they're all from a different program, each program from one of our first eight issues.

Somehow the separate lines from separate magazines

Figure out where these program lines came from and you could be on to a winner!

have combined to form one program.

Can you figure out from which programs in which issues the lines came?

If you can, you could win Broadway Electronics' new combined printer interface and user port.

All you have to do is discover which programs the lines originally appeared in. Next pop down the numbers of the pages they appear on.

Then tell us the feature you would most like to see in a future issue of *Electron User* and send it all to us.

Entries must be received by June 30, 1984, and the judges' decision will be final.

WE HAVE A WINNER

Remember in the March competition we asked you to tell us which of a set of nine variable names were incorrect?

The response was fantastic, most people realising that all you had to do was type the names into the Electron and it would throw out the bad ones.

The winner of the 10 Program Power cassettes is F.J. Lancaster of Cuckfield, Sussex.

Not only did he get the variable names right, but he had what in the judges' opinion the best reason for being an Electron user:

"I'm an Electron user because I am a collector of rare editions".

PLUS many thousands of software programs – games, educational and business packages.

There's much more to summer we go to a new us much more room to

Alexandra Palace, London N22. Thursday

- ★ **SEE the latest software – hundreds of new games, educational and business programs.**
- ★ **SEE all the latest add-ons – never before have so many exciting new peripherals been launched.**
- ★ **SEE all the latest techniques – and get free advice from our team of experts, writers and programmers.**
- ★ **Make a note in your diary – NOW!**

You must see for yourself all the rapid developments in the ever-expanding world of the Electron and BBC Micro!

show. So this
home – to give
show it all.

to Sunday, July 19 to 22

Reduced prices for School/College Groups

Entry only £1 per student if bookings are made in advance. Send your cheque (made payable to Database Publications) and SAE to:

Electron & BBC Micro User Show
68 Chester Road, Hazel Grove
Stockport SK7 5NY Tel: 061-456 8383

Valid for a minimum of 10 people

SAVE MONEY with our Special Travel and Hotel Offer

Visitors to the Show can obtain cut-price rail tickets from ANY station in the United Kingdom – plus special reduced prices at London hotels.

For full details write to:

Travel Offer, P.O. Box 1, St. Albans AL1 4ED with SAE or Telephone: St. Albans 34475 quoting: The Electron & BBC Micro User Show.

**This voucher is worth
£1 per head**

By handing in this voucher at the door you save £1 off the normal admission price of £3 (adults) and £2 (children).

(Valid for a maximum of 4 people)

10am - 6pm, Thursday, 19 July
10am - 6pm, Friday, 20 July
10am - 6pm, Saturday, 21 July
10am - 4pm, Sunday, 22 July

**Alexandra Palace
Wood Green, London N22.**

Number attending: 1 2 3 4

Exciting News for Electron Users
Now Available

CHESHIRE CAT **EDUCATIONAL SERIES** from **AMPALSOFT**

CHESHIRE CAT

The First name in Educational Software.

An exciting range of top quality programs covering all
needs from pre-school to 'A' level.

Ampal Computer Services Ltd.

Electron Users:

THE ONLY ADD-ON YOU NEED EVER BUY!

THE SIR PRINTER/ADC INTERFACE

- **NOT JUST ANOTHER JOYSTICK PORT – FULL ANALOGUE-TO-DIGITAL CONVERTER** provides fully proportional control, essential for use with graphics packages, digitizers, etc; ideal for scientific & educational applications; usable with a wide variety of BBC Micro-compatible analogue and switched Joysticks/Paddles; complete compatibility with **ALL** currently-available software.
- **CENTRONICS PRINTER INTERFACE** – allows use of a wide variety of parallel printers including entire Epson range; complete firmware support included.
- **HIGH-QUALITY MOULDED CASE** – attractively styled plastic unit bolts securely to the back of the computer.
- **EASY TO FIT** – no soldering, simply plugs straight into computer's rear edge-connector and is held in place by twin bolts; edge-connector on back of unit provides for further modular expansion if necessary.
- **THE SIR ELECTRON PRINTER/ADC INTERFACE £65.95**

Also
available

THE SIR ELECTRON ROM/RAM EXPANSION BOARD

- Provides 12 extra sockets which support a variety of ROM and RAM configurations up to a max of 192K for ROM and 16K for RAM.
- ROM and RAM is normally paged in 16K blocks but is easily switchable to 2K, 4K or 8K blocks.
- **Price: £59.95**
- Easy to install – just plugs in.
- Professional styled casing bolts to rear of computer.
- Fully buffered design.
- Permits use of most BBC ROM-based software including utility ROMs, wordprocessors & languages.

*All our prices are inclusive of VAT unless stated otherwise.
Postage and Packaging: Please add £10 P&P (large items: Printers, Monitors, etc.),
Small items: ROM Boards, Disc Drives, etc. – FREE
Access/Barclaycard Telephone orders welcome.*

USERS & DEALERS

Signpoint Ltd.
Computer Technology

The first Joystick Interface
on the market.

JOYPORT

Controls over 80% of
available arcade games.

- Unlike others, our product is intelligent and in stock.
- * Uses 'Atari style' 9 pin joysticks
- * Just plugs in, no soldering
- * Full after sales support.
- * Does not overload the limited Electron power supply.

£16.95 inc vat and P & P

Same Day Despatch

ALSO IN STOCK

PRINTPORT

Centronics Printer Interface.

- * Suitable for all Centronics Printers.
 - * Recognises *FX, VDU & CTNL Codes.
- Supplied complete with lead and software.

£44.95 inc vat and P & P

Send cheques to :-

Signpoint Ltd.,
166a Glyn Road,
London E.5.

This maths workout is based on articles that originally appeared in The Micro User. Our thanks to our "big brother" magazine for permission to use it.

AS we have mentioned in previous articles, the Electron – and all other machines based on the 6502 microprocessor – handles its binary numbers in groups of eight bits at a time. Such a group of eight is called a byte.

However, while handling eight bits at a time is satisfactory from the machine's point of view, from the human side of things it's rather difficult to manage.

Those 1s and 0s are far too prone to error. Look at Table I for instance. It contains an error – can you find it?

It's all too easy to slip up when handling binary numbers – a single 1 in the wrong place and all is lost!

To make things easier to deal with, when I am copying out binary numbers I put a wavy line between bits 3 and 4

%10111011 = 187
%10101101 = 173
%10001111 = 151
%11110110 = 246

Table I

to split the byte into two equal groups of four.

For example, if I were copying:

% 10001111 (= 1 4 3)

I would write:

% 1000 %1111

Actually, splitting the byte into two groups of four bits is standard practice – each group of four bits is called a "nibble", would you believe.

It's not too hard to see that the biggest number you can represent in a nibble is 15, and the smallest is 0.

%1111 and **%0000**

respectively. After all, you've only got four bits to play with!

So we can split up our byte into two nibbles of four bits each.

Now when we split up a binary number in this manner we call the "left-hand" nibble the most significant nibble (MSN) and the "right hand nibble" the least significant

MIKE BIBBY'S MATHS workout

Exercises for the Electron

nibble (LSN).

We have already created one new number system – the binary system.

Let's design another one that combines the advantages of the denary system with those of the binary.

That is, it will be easy to read and write, yet will still allow us to perceive the binary manner in which the machine handles things.

The system we want is called hexadecimal.

This consists of using our standard digits 0 to 9 for the number zero to nine respectively, and the letter A to F for the numbers 10 to 15.

In this way it allows us to code the numbers available in a nibble (that is, 0 to 15) with just one digit. This digit will be in the range 0 to 9 or A to F.

It may take a while to adjust to the idea of using letters of the alphabet for numbers, but

it soon becomes second nature.

You just have to get used to counting:

**1,2,3,4,5,6,7,8,9,
A,B,C,D,E,F**

Remember, there are B people in a cricket team, D in a rugby league team and F in a rugby union team. There are C months in a year, and E days in a fortnight.

Now just as we prefix all our binary numbers with %, we prefix our hexadecimal numbers with &, to avoid confusion. So &F means 15, while &9 means 9.

Studying Table II will really pay dividends – I suggest you practise writing down bit patterns of nibbles and their hexadecimal equivalents until it becomes second nature.

Given that we can encode a nibble in one hexadecimal digit, and that a byte consists

of two nibbles, it should readily be apparent that we can encode a byte as two hexadecimal digits side by side, for example:

That is:
%10101001 = &A9 = 169

You just split the byte up into two nibbles – a left hand and a right hand nibble, encode each as a hexadecimal number, then put the two side by side.

You can go from hexadecimal to binary just as easily:

That is:
&8D = % 10001101 = 141

Although you have probably never thought of it in these terms, you are well aware that the value a digit represents depends on the column it is in.

The number 230 is not as large as 320, though both numbers contain the same digits.

In hexadecimal coding too the column a digit is in is important.

For example, &10 is far greater than &01. In binary each column is worth twice the preceding one.

In denary, our usual number system, each column is worth 10 times the preceding one.

In hexadecimal, each column is worth 16 times the preceding one.

Believe or not, the columns in a four digit hexadecimal number, from greatest to least, are worth **4096, 256, 16** and **1** respectively.

This means that:
&1101 = 4096 + 256 + 1 = 4353

For the moment let's concentrate on the two digit – that is, two column – hexadecimal number, as these are all we need to store our bytes in.

In this case the left-hand

column is the "sixteens" column, the right hand the units column.

So:

16 1
 & 2 1 = 2*16+1 = 33
 16 1
 & 2 D = 2*16+13 = 45
 16 1
 & 8 0 = 8*16+0 = 128
 16 1
 & C 0 = 12*16+0 = 192

To translate a two digit hexadecimal number into denary simply multiply the number in the left-hand column by 16 and add it to the number in the right-hand column - remembering to translate A to F if necessary.

The second column has the value 16 since the first column can only handle numbers up to 15 (&F) - the largest you can fit into a nibble (%1111).

After 15, you have to use a second column for 16 - that is &10.

Just as in denary, we "carry" at 10 since the largest value our columns can handle is 9, so in hexadecimal we

carry at 16, since the largest value our columns can handle is 15 (&F).

It is the fact that we carry at 16 that gives this number system its name "hexadecimal". Here "hex" stands for 6, "decimal" for ten. "Hexadecimal" = 6 + 10 = 16.

Given a second column, &10, as we have seen is 16, 17 will be &11, while &12 is 18 and so on until we reach 31, which is &1F.

We have then run out of legal digits for the units column. So if we want to go on to 32 we had better give ourselves another 16, and set the units column back to zero, that is &20.

Another way of looking at the second column is that it comes from the most significant nibble.

To turn the least significant nibble into the most significant nibble we have to shift it over to the left four times.

If you cast your mind back to last month, this is equivalent to multiplying it by

two four times in succession. That is:

$$2 \times 2 \times 2 \times 2 = 16$$

This is why a hexadecimal digit representing the most significant nibble is 16 times larger than the same digit representing the least significant nibble.

The largest number you can store in a two-digit hexadecimal number is &FF = $15 \times 16 + 15 = 255$.

This is, of course, the same as the largest number we could store in a binary byte. We often refer to a two digit hexadecimal number simply as a byte.

To obtain the hexadecimal equivalent of a positive integer (whole number) less than 256, we divide it by 16.

The quotient is the left hand digit, the remainder the right hand, translating into A to F where necessary.

For example:

$$174 \div 16 = 10 \text{ r } 14$$

That is:

$$\text{\&A r \&E}$$

Hence 174 = &AE

Fortunately we don't have to go to such lengths. The Electron allows us to simply print out the hexadecimal equivalent of decimal numbers and vice versa.

For instance:

P. &BC will give

192

while P. &141 will give

&8D

Decimal	Binary	Hexadecimal
0	0000	0
1	0001	1
2	0010	2
3	0011	3
4	0100	4
5	0101	5
6	0110	6
7	0111	7
8	1000	8
9	1001	9
10	1010	A
11	1011	B
12	1100	C
13	1101	D
14	1110	E
15	1111	F

COMSOFT

QUALITY EDUCATIONAL SOFTWARE

PLAYBOX

BBC MICRO B/ACORN ELECTRON

A series of three programs that will provide hours of fun for all the family.

MEMORY is a game for two players, where the computer displays a series of pictures which must be paired off.

HANGMAN has a vocabulary of 280 words and a facility to define your own words. Categories include countries, animals, birds, world capitals and others, for age seven upwards.

BRICKSMASH traps you behind a red brick wall. Answer the general knowledge questions correctly to break down the wall and escape.

All programs are very user-friendly with full colour graphics and high quality sound. All three programs are available on one cassette for £6.50 incl. Also available on 40 Track disc for £8.50.

AVAILABLE BY MAIL ORDER OR FROM GOOD COMPUTER OUTLETS.

PLEASE STATE WHICH COMPUTER WHEN ORDERING.

EPIC ADVENTURES

FULL-SCALE MACHINE CODE ADVENTURES FOR THE BBC AND ELECTRON

OUR AMAZING NEW ADVENTURE IS NOW AVAILABLE

THE WHEEL OF FORTUNE

They said it couldn't be done on the Beeb - but we've done it!

The Wheel of Fortune is a classic puzzle adventure, with 250 locations, and brings the following advanced features together for the first time:-

- * Sophisticated language and speech interpreters capable of accepting single or multiple commands, up to 254 characters in length. Complex multiple commands are phrased just as you would speak them.
- * Moving characters with varying moods. These characters remain active whether you type anything or not. Their reactions to you will depend upon the way in which you have previously treated them. The speech interpreter allows you to talk to them, to either give them commands or information, or to ask them questions.
- * Instant half-screen teletext graphics for each location (BBC only). These remain on screen with the text and both may be studied simultaneously. The graphics may be switched on or off, as required.
- * You may save your position on tape OR DISC, using a different filename for each position.
- * Up to 10 commonly-used command sentences can be stored and called up as required. The stored sentences may be changed during the game.
- * No frustrating illogical mazes * Humorous character behaviour * Scoring * Fast response * Fully disc compatible * Etc. Etc.

This masterpiece of programming is available for BBC or Electron (state which) for only £9.95. Also available are our 3 popular text adventures. Each has approx. 230 locations and costs just £7.95.

1) Castle Frankenstein 2) The Quest for the Holy Grail 3) The Kingdom of Klein

P&P FREE if ordering 2 or more games, otherwise add 50p

Adventure and action for BBC-B and Electron

Johnny Reb

NEW from WARMMASTER

There's still plenty of fight left in the Confederate South as each side selects forces to manoeuvre on a full-graphics battlefield. Play against the computer or challenge a friend to perfect your tactics and re-write American history.

BBC-B £6.95 ONE OR TWO PLAYERS

the Stolen Lamp

This new Lothlorien adventure game is played in an Arabian Nights fantasy. You have to retrieve the Emperor's stolen lamp and return, by magic carpet or camel, with as much treasure as you can. Beware the enchantress and the denizens of the Blue Lizard Cafe.

BBC-B £6.95 ONE PLAYER

NEW from ADVENTURE MASTER

With 'Warmaster', 'Actionmaster' and the new 'Adventuremaster', Lothlorien have justifiably earned a reputation as the mind stretchers.

Lothlorien add new titles every month and are always interested in hearing from programmers with first-class software.

Lothlorien games are available from most leading software specialists, or direct by post at no extra cost.

PARAS Your hand-picked force has to capture a river crossing behind enemy lines in this all-graphics wargame. 10 levels of play.

BATTLEZONE 2000 Take on a computer-controlled battle machine in this futuristic wargame.

ROMAN EMPIRE Building an army is only the start of an Empire-building campaign. Leadership, morale and fighting efficiency count. For more. 3 levels of play.

CONFRONTATION A build on base for non-nuclear conflict provides 2 players with scope to re-enact any 19th or 20th Century Campaign. Cassette contains master program plus Stalingrad scenario (not Electron).

Please send me back box: M.C. Lothlorien, 56a Park Lane, Poynton, Cheshire SK12 1RE. Tel: 0625 876642

ELECTRON

BBC "B"

DIMAX STRUCTURED SOFTWARE

The policy of DIMAX is to produce well written BASIC programs that are not only enjoyable to play, but also provide good working examples of structured programming that can assist in the development of programming skills.

TAPE 1 — SPACE TREK

A traditional computer game entirely re-written to take advantage of the program structures and advanced facilities of the ELECTRON and BBC micros. Provides practice in the use of co-ordinates and bearings.

TAPE 2 — TEN EDUCATIONAL GAMES

All games easily adaptable to suit different ages and needs.

PLUS STANDARD PROGRAMMING FORMAT

A development program containing opening and closing routines, error traps, and over 20 useful library PROC/FNs that can be used in your own work.

Tapes £4.95 each (inc. P and P). **£1 discount** if both tapes ordered. From **DIMAX Structured Software**, 15 Winchester Road, Northampton NN4 9AZ.

Please mention this magazine by name when ordering.

NEW

for BBC B and ELECTRON

The latest release from SQUIRREL

TRAFALGAR

Command your own fleet! Battle plan unfolds to sea level view of individual engagements.

Cannonballs smash into hulls and tear holes in sails! Magazines explode! Ships sink! Fire ships can be sent downwind! Flags are struck and prizes taken! £8.00

The game that all the family can play!

SUPERGOLF

Amazingly realistic — the ball speeds into the air, slows, curves down and rolls. Bunkers, water, O.O.B., and a variable gusting wind to cope with! Up to 4 players with score card for each! £7.50

Favourite with the younger players!

BUNFUN

Icing and nuts have to be squirted on as the bun go past! Good reactions, rhythm, and timing required! £6.50

ALL THESE GAMES FEATURE SUPERB MULTICOLOUR GRAPHICS

SCORBY SOFT EDUCATIONAL SOFTWARE FUN MATHS (Ages 7-13)

Two full-graphics packages designed to improve mental number work and logical thought skills. All programs are fun to use and are proving very successful in speeding-up logical thought and mental arithmetic. BBC versions of the same programs are used in schools.

- SQUARE PUZZLES (4 programs) £6
 - INVADER MATHS (2 programs) £4
- (Buy both for £6.50)

INFORMATION HANDLING £11.50

A two-cassette package of programs and data-bases to introduce you to the world of information technology. Use large data-bases, create and use cassette files, produce your own electronic dictionary. Features 19th century population survey with full documentation on how to computerise similar information for your own area. This package has been written for new computer users or anyone who wants an introduction to information handling.

Cheques etc. to:

SCORBY SOFTWARE,
27 Scalby Avenue, Scarborough YO12 6HW

ELECTRON PR-INTERFACE

Now the ELECTRON is the machine to do the job. No longer just a games machine. Connect a PR-INTERFACE to the output port at the rear of the Electron and virtually any printer will work immediately. Now you can have full listings of programs, printouts from your programs, screen dumps of your favourite games and much more. Use the ELECTRON in education for examination classes, development work and many other purposes and have the results printed out immediately. Printers connect straight in with no soldering, no wobble, no external power supply and no software required.

Turn your ELECTRON into a printer computer for just £32.50 + £1.00 pp and VAT. Suitable printers available from £120 + VAT. Total including a 4' lead and VAT from £179.00. Ask for more details on our software and printers.

*** SEIKOSHA PRINTERS**
A new range of printers (Spectrum Compatible) replacing existing models.

Prices from
£120-£300

EXPLOSIVE

Software

DYNABYTE

NEW! Lemming Syndrome

Mad Marco is on the rampage and has blown the bridge to the mainland. The panic-stricken population are hurling themselves into the shark infested waters and your job is to bounce them to safety whilst avoiding the marauding sharks and the desperate attempts of Marco to blow up your liferaft. This highly original, fast and furious game is full of special features and options designed to make your task harder as you get better.

Machine Code £7.95

Corporate Climber NEW!

Caught in the capitalistic pursuit of corporate expansion, your ambition is to attain the ultimate accolade - the key to the executive washroom! Avoid the eager taxmen in the lifts ready to hinder your climb to power and beware of too much stress resulting in high blood pressure. Definitely not for the faint hearted entrepreneur.

Machine Code £7.95

Exciting and original software for the Acorn Electron

Pool

Classic representation of the real thing incorporating excellent high resolution smooth action graphics for accuracy and making full use of sound. Start practising now and avoid being hustled. You control the cue angle and strength of shot. A real pleasure to play.

Machine Code £7.95

Horserace

An exciting and colourful game complete in every detail with tumbling jockeys, realistic horses, TV van, tote and leader boards, waving crowds and much more. Don't lose your money at the track, try HORSERACE instead. Suitable for 1-6 players.

Basic + M/C £6.95
(All programs require Series 1.0S)

Also available:

ELECTRON-AID. An extremely useful 2 program utility which simplifies some of the more difficult aspects of programming your computer.
CHARACTER. Easily defines/edits multicoloured characters. VDU 23 statements are automatically generated and can be saved for later use. Characters also displayed normal size on screen.
SOUND LAB. Experiment with up to 7 envelope and 15 sound commands simultaneously. Sounds can be played individually or in sequence. All parameters clearly displayed and easily altered.
Comes complete with full documentation and a user key strip.
Excellent value at only £6.95

All programs available from most good computer shops or direct from

Micro Messages

The phone's up to monkey tricks!

HELP! I like to do the characters in Casting Agency but even after reading the November article, I am still having trouble with the characters in the April magazine.

The monkey and the telephone come out in bits and not in line. Please help. — **David Matthiesen (aged 10), Hythe, Hants.**

● The following two programs should clear up your problem. Remember that you should type in all the VDU23s beforehand or else your Electron won't know what's happening.

Monkey:

Games for joystick

FOLLOWING the highly successful launch of the First Byte Electron joystick Interface at the user show in London, we have received many new games from software houses which we have tested to ensure they work with our interface.

So here is the list of all games known to work with the First Byte

Interface:

Program Power: Killer Gorilla, Moon-raider, Positron, Croaker, Swoop, Bandits at 3 O'Clock, Escape from Moonbase Alpha, Cybertron Mission.

A&F: Cylon Attack, Kamakaze, Chuckie Egg.

Romik: Alien Break In, Atom Smasher, Birds of Prey.

Bug-Byte: Galaxy Wars, City Defence.

Acornsoft: Monsters.

Dynabyte: Pool.

Postern: Pengwyn.

Alligator: Lunar Rescue, Bugblaster, Blagger.

Visions: Snooker, Daredevil Dennis.

Optima: Bed Bugs.

Other games do work and we can provide a factsheet on how to add any new games to the games menu program provided free with the interface.

Interface owners can get details by sending a SAE to us. We will also keep owners updated via Electron User as the response from advertising in your magazine has proved how popular a magazine it is.

Finally, we have modified the design so that the rapid fire mode of Quickshot II will work on our interface.

All future production runs will incorporate this modification, but if anyone with an early model of the interface requires this modification, then they can return it to us with £1 to cover post and packing and we will be pleased

to do the necessary. — **Ray Threadgould, FBC Systems, Derby.**

● Many thanks for the list. We've had any number of enquiries about what games will and will not work with what joystick interface. Hopefully the manufacturers of the other interfaces will keep us informed.

Certainly Signpoint, manufacturers of the Joyport, have told us that they seem to be extending the range of games every day.

Disabling Break

CAN you help out with an Electron problem?

The Break key is the only complaint I have with this excellent machine. When copying or using the cursor keys, accidents can happen and Break is pressed with great anxiety to follow.

The normal *key 10 disable command does work on a home copied/listed program, but not on a proprietary purchase tape, such as Acornsoft.

The key command only simulates OLD/List and of course loses the game score.

I have a two year old active son who thinks the Break key is great fun, especially when my older boys are concentrating on a good game.

Can you suggest a practical method of disabling the Break key, to

be used as a separate entry before loading any tape. No suggestions for the two-year-old please, they have already been tried!

As an interim solution, the small hinged section of Lego — the roof of a Shell petrol tanker — using double sided tape, can be positioned over the Break key to prevent the majority of accidents, and of course, can be pivoted up to actually use it when required.

Perhaps you could let other people know for me.

One warning — double sided tape is not strong enough for a two-year-old!

Thanks for a good magazine. — **S.P. Taylor, Marlborough, Wilts.**

● The problem is that the Break key is directly

linked to the 6502 chip at the heart of the Electron, and there's no way of disabling it with software. Having said that, we have little doubt our readers will come up with something.

Spaces problem

I BUY your magazine every month and find it good value and informative. However I feel that there are one or two points which could be improved upon, particularly with regard to program listings.

Some programs, such as the Parky's Peril game published in your March issue, have strings of spaces in them.

Because the spaces

One way of disabling the Break key

WHAT would you like to see in future issues of Electron User?

What tips have you picked up that could help other readers?

Now's here is your opportunity to share your experiences.

Remember that these are the pages

that you write yourselves. So tear yourself away from your Electron keyboard and drop us a line.

The address is:
Micro Messages
Electron User,
Europa House
68 Chester Road
Hazel Grove
Stockport
SK7 5NY.

Micro Messages

From Page 61

are not distinct characters, it is not always possible to tell how many there are if there are several together.

In this case, this prevented the program from working properly because these strings were then "folded" into the shape of the maze by the insertion of back-space and carriage return characters.

It would seem to me to be preferable to say, for example (three spaces), explicitly rather than leave the user to guess.

Another point of doubt arises because of the confusion between "8" and "B" in hexadecimal numbers. The symbols you use for these are too alike, and confusion can arise. —

Brian Matthews Sheffield.

● Teeth Gnashing Time at the *Electron User*. We thought we'd tamed this beastie. Point taken and we'll be looking at listings to avoid this in future.

It's not all that hard to sort out but we can see how frustrating it could be. As it is we're asking anyone who submits programs to us in future to use SPC or STRINGS to produce the spaces. This will make everyone's life easier.

Hibernating beast

I BOUGHT an *Electron* from Vector Marketing on December 10 1983 and after about a fortnight of very intermittent use, the line of keys 7|U|J|M ceased to work.

Because of their Christmas break I couldn't contact Acorn until early January

1984. They sent me a label to return the machine.

I sent it on January 7, it came back on February 14 and I was unable to get at it for a couple of days.

When I did, after 10 minutes use it would print only "Zzzzzz..." and none of the control keys worked. Winter hibernation?

I contacted Acorn again requesting refund

or replacement.

Again I was directed to return it to Retail Control Systems — which I did on March 3 as soon as Acorn sent the label.

I now sit reading your magazines hoping to become an *Electron USER* instead of only an owner!

Fourteen days use out of 102 days ownership isn't typical! hope, despite your

report of up to 25 per cent failure rate!

Anything you can do to help? — **J. Williamson, Stanley, Co. Durham.**

P.S. Love your magazine! Wish I could put it to use!

● There's not much we can do to help except air your grievances. Certainly your case does seem untypical. Hope you join our band of *Electron* users soon.

SAVING THE SITUATION

I READ with interest the letter "Problems of saving" in the April issue of *Electron User*.

Before purchasing my *Electron* I took my cassette recorder to the shop to make sure it was compatible, a Din lead was fitted and the exact setting to load a program was determined for me.

Arriving home with my *Electron*, I found to my horror I was unable to save programs with the Din lead.

Returning to the shop, I was told they only ever had problems loading not saving programs.

My Din lead was exchanged for a split mic, ext L.S. remote lead, of which three new ones had to be tried before one was found to work. My advice to

potential computer buyers is always thoroughly check your cassette recorder and lead.

If a new cassette recorder is found to be needed, shop around.

A Bush cassette in the computer shop was selling for £34.95 but the identical model was selling for £19.95 in the local radio shop.

Why should the computer shop be so dear? — **M Senior, Roth-erham.**

● Thanks for your advice. Saving on cassette seems to be a major problem for *Electron* users. Perhaps owners who have a cassette recorder that works perfectly with the *Electron* could write in and tell us about it so we could

compile a list.

IN addition to the suggestions made in reply to Mr G. Dean in the April issue of *Electron User* may I offer the following.

The problem may be an impedance mismatch, which in my case was overcome by inserting a 4.7kohm resistor in series with the centre lead of the mic cable.

If an $\frac{1}{4}$ watt resistor is used, the small physical size will enable it to be wired inside the jack which plugs into the recorder.

This operation costs only a few pence and is worth trying before assuming the recorder is incompatible with the *Electron*. — **P. Hodge, Leeds.**

FURTHER to Mr Dean's letter in the April issue of

Electron User about having problems saving programs on the *Electron*, I was wondering if he and others have been sold cassette recorders that are not compatible.

When I bought my *Electron*, I was assured the cassette recorder I bought with it was compatible, and having had this changed twice and spoken to Acorn about the problem, I have finally settled on the BBC data recorder which works perfectly.

May I suggest that your readers who are just loading programs with the cassette recorder check that they can save programs as well, especially if they were sold the cassette recorder with the *Electron* as I was. — **G. Nicholls, Padgate, Warrington.**

SPECIAL OFFER!
Deduct £1 per cassette when ordering 2 or more.

TOP QUALITY SOFTWARE FOR THE ACORN ELECTRON

ACORN ELECTRON

CENTIBUG £7.95
The centibug descends from the top of the screen weaving intimidatngly between the mushrooms. Your objective is to shoot all the segments of the centibug before it reaches the bottom of the screen. Features include: spiders, snails, flies, 6 skill levels, hi-score, rankings, and increasing difficulty.

ALIEN DROPOUT £7.95
A novel and unusual program. Arcade-action with this exciting multi-stage shooting game. The objective of the game is to shoot the aliens out of their "boxes" before the "boxes" fill up. Once full, the aliens fly down relentlessly, exploding as they hit the ground. The game features include: 6 skill levels, rankings, hi-score, increasing difficulty.

INVADERS £7.95
48 marching invaders drop bombs that slowly erode your defences, and two types of spaceship (normal and double speed) fly over releasing large bombs that penetrate through your defences. Increasing difficulty, hi-score, rankings, superb graphics and sound.

WORLD GEOGRAPHY £7.95
This program covers 166 countries which are divided into 8 categories of difficulty. Each country is pinpointed on an accurate hi-resolution screen map of the world, and the user is asked the capital and/or population. At the end of the test, the percentage of correct answers is given, so that the student can easily monitor his increasing geographical knowledge.

FRUIT MACHINE £7.95
Probably the best fruit machine implementation on the market. This program has it all... HOLD, NUDGE, GAMBLE, spinning reels, realistic fruits and sound effects, multiple winning lines. This is THE fruit machine program to buy.

CONSTELLATION £7.95
This fascinating program enables the user to "view the stars" from any point on the Earth's surface, on any date and at any time. A total of 455 stars in 50 constellations may be viewed, and the "telescope" may be moved up, down, left or right, zoomed in or zoomed out. The stars can be displayed by magnitude or constellation.

DISASSEMBLER £7.95
A relocatable disassembler which, unlike some similar programs, allows the disassembled source code to be output to memory. It may then be modified and re-assembled. Other features: page-mode option, output to printer if required, output of ASCII symbols if required.
